independent mode in which a body may be displaced.

Thus, a wheel the axis of which is fixed, or a roller which
is compelled to roll on the ground without sliding or turn-
ing, has but one degree of freedom—that is, it can move
only forward or back. If it can turn without sliding, or
slide without turning, either in the direction of its rolling
or in that of its axis, it has two degrees of freedom; if it
is capable of all these motions, it has four degrees of free-
dom. If one end of it can rise above the surface of the
ground, it has five; if both ends can leave the ground, it
has six degrees of freedom and is perfectly free.—**Free-
dom of repeal†**, a free, unconditional recall.

I kiss thy hand, but not in flattery, Cæsar;
Desiring thee that Publius Cimber may
Have an immediate freedom of repeal.

Shak., *J. C.*, iii. 1.

Freedom of the will. See *will*. = *Syn.* 1. *Freedom*, *Lib-
erty*, *Independence*; scope, range, play, swing, latitude.
The first three words are sometimes used as synonymous,
but they are clearly distinguishable. *Freedom* is the
most general in its application. *Liberty* is commonly
used where reference is made to past or possible physi-
cal confinement or restriction: as, the prisoners were set
at liberty. *Freedom* is used where emphasis is laid upon

large opportunity given for the exercise of one's powers: as, the *freedom* of country life; or where the previous or possible restriction has been or is legal or moral: as, the slave was given his *freedom*; he expressed his views with *freedom*. *Liberty* is more often public; *freedom*, personal and private. *Liberty* has more in mind protection from external constraint or from the aggressions of power; hence, in civil affairs, *liberty* is *freedom* as outlined and protected by law. *Independence* is more exact, expressing not only self-direction but exemption from control, and even lack of connection. There may be *liberty* without *independence*, as in the case of a self-governed colony, and there may be *independence* without *liberty*, as in the case of a despotic monarchy.

Ye winds, that wafted the pilgrims to the land of promise, fan, in their children's hearts, the love of *freedom*! . . . Speak, speak, marble lips! teach us the love of *liberty* protected by law. Everett, Enology of Lafayette.

This is got by casting pearl to hogs;

That bawl for *freedom* in their senseless mood,

And still revolt when truth would set them free.

License they mean when they cry *liberty*;

For who loves that, must first be wise and good.

freehold (frē'hōld), *n.* [*< free + hold*, *n.*] 1. In law: (*a*) Originally, in England, an estate in land in possession held by a freeman; a free socage or feudal estate; now, an estate in fee simple or fee tail, or for life, as opposed to *copyhold*. See the extract.

The distinguishing marks of a *freehold* (in England) were, (1) that it should last for life, . . . (2) that the duties or services should be free: that is, worthy the acceptance of a free man. To fulfil this latter condition, it was necessary that the services by which the land was held and by the non-performance of which it would be forfeited should be honourable (that is, not servile) in respect of their quality, and certain in respect both of their quality and quantity. Mozley and Whitely, Concise Law Dict.

(*b*) Hence, in general, an estate in land such as was originally considered as being an ownership of the soil itself, as distinguished from a mere use or chattel interest in it. That is, it is an estate in possession, either of indefinite future duration, transmissible to one's heirs (called an estate of inheritance), or for the life of either the owner or some one else; or "an estate in possession, the duration of which is not fixed or ascertained by a specified limit of time" (*Digby*).

2. A parcel of land held by either of the tenures above described.—3. Figuratively, any free or unrestricted possession, or right of possession; that which belongs to one absolutely.

My heart's good *freehold*, sir, and so you'll find it.

Beau. and Fl., Wit without Money, li. 4.

All the authorities speak of fellowships in colleges as *freeholds*. D. Webster, Speech, March 10, 1818.

freeholder (frē'hōl'dēr), *n.* [*< freehold + -er*.] In law, one having the present seizin or possession of land by virtue of an estate greater than one limited by a specified time—that is to say, having a fee or a tenancy for life of the tenant, or for life of a third person; one who holds an estate in fee simple or fee tail. See *freehold*, 1.

Under various laws in England and the United States, the right of suffrage and the qualification for some minor local official duties or trusts have been conferred on freeholders as distinguished from other inhabitants. In Scotland the term is applied to one holding lands of the crown.—**Chosen freeholders**, in New Jersey, a board of county officers having charge of the finances of the county, corresponding to the county commissioners or the board of supervisors of other States.—**Freeholders' court**. freemason (frē'mā'sn), *n.* [Not found earlier than mod. E.: *< free + mason*.] A member of an order, fraternity, or brotherhood forming a secret society, or series of affiliated secret societies called lodges, now existing in all the countries of Europe, in many parts of America, and in other parts of the world where Europeans have settled in larger or smaller communities. This society is founded on and professes the practice of social and moral virtue; truth, charity in its most extended sense, brotherly love, and mutual assistance being inculcated in it. It possesses an elaborate ritual, numerous grades of officers, and many secret signs and passwords, by which members may make themselves known to other members of the craft in any part of the world. Secret organizations of free or enfranchised operative masons, with similar rituals, were formed in the middle ages, when skilled workmen moved from place to place to assist in building the magnificent sacred structures—cathedrals, abbeys, etc.—which had their origin in those times, and it was essential for them to have some signs by which, on coming to a strange place, they could be recognized as real craftsmen and not impostors. There was such a society of actual masons and builders in England in the seventeenth century, and some persons not belonging to the craft had been accepted as members of it; hence the full name of the present fraternity, "Free and Accepted Masons" (abbreviated *F. and A. M.*). Modern freemasonry dates from the organization in 1717 of the four lodges then existing in London, on a new basis, into a grand lodge, by which other grand lodges were chartered. To mark its departure from the limited scope of the original society, the principles and methods of the order are called *speculative masonry*, the terms and ritual of operative masonry being retained. Fable, though absolutely without any historical basis, takes the history of the order back to the Roman empire to the Pharaohs; to the building of Solomon's temple or the tower of Babel, or even to the building of Noah's ark.

free-thinker (frē'thing'kēr), *n.* One who is not guided in the formation of his beliefs by obedience to authority, but submits the claims of authority to reason as the ultimate arbiter. The early application of the term was to those who occupied a rationalistic position in regard to current religious beliefs and dogmas; hence it acquired the still current sense of skeptic, infidel, and even atheist. The word, though employed earlier, is generally supposed to have been brought into common use in 1713 by the publication of Anthony Collins's "A Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called *Freethinkers*." Although this work defines *free-thinking* as the endeavor to judge a proposition according to the weight of evidence, and does not explicitly maintain any proposition which can offend a Protestant, it was rightly judged to be a covert attack upon fundamental tenets of the Christian religion. The free-thinkers specifically so called formed a class of deistical writers in England in the seventeenth and eighteenth centuries, the chief of whom were Toland (died 1722), Anthony Collins (1676-1729), Woolston (1693-1733), Tindal (died 1733), and Bolingbroke (1678-1751). See *deist*.

The idiot is supposed to say in his heart what David's fool did some thousands of years ago, and was therefore designed as a proper representative of those among us who are called atheists and infidels by others, and *free-thinkers* by themselves. *Addison, Religions in Waxwork.*

Is he a churchman? then he's fond of power:

A quaker? sly: a presbyterian? sour:

A smart *free-thinker*? all things in an hour.

Pope, Moral Essays, I. 157.

The *freethinker* perhaps too has imbibed his principles from the persons among whom he was bred up.

A. Tucker, Light of Nature, V. viii.

Who born within the last forty years has read a word of Collins and Toland and Tindal and that whole race who called themselves *freethinkers*?

Burke, Rev. in France.

If Collins included as *freethinkers* all who differed from the prevalent creed of the time, Bentley would not deny that *freethinkers* had done good service. If, on the other hand, Collins meant, as Bentley assumed him to insinuate, that all these *freethinkers* were atheists, then he was palpably wrong.

free-thinking (frē'thing'king), *n.* The act or the habit of inquiring freely into the truth of a fact or point of faith in which authority requires implicit belief: especially applied to skeptical inquiry into the supernatural elements of Christianity.

freezing-mixture (frē'zing-miks'tūr), *n.* A mixture that has the property of producing a sufficient degree of cold—that is, a sufficiently rapid absorption of heat—to freeze liquids. In general, such a mixture consists of a solid and a liquid in which the solid rapidly dissolves: for example, hydrochloric acid and sodium sulphate. Its effect is due to the fact that the change of a solid to a liquid requires a certain amount of heat (see *latent heat*, under *heat*), and if this change goes on rapidly, a considerable lowering of temperature results. In the common case of pounded ice and salt, which gives a temperature of about 0° F. (—18° C.), there is a double change, both resulting in the absorption of heat—the melting of the ice and the solution of the salt. See *ice-machine*.

freezing-point (frē'zing-point), *n.* The temperature at which a liquid freezes; loosely, the temperature at which ice melts. The freezing-point, in the strict sense, depends on many circumstances difficult to control, and many liquids, including water, can with care be cooled several degrees below their melting-points without freezing. The melting-point of ice (water), however, is relatively fixed and readily observed. Consequently, the melting-point is always substituted for the freezing-point in making thermometers, although it is generally called by the latter name.

The *freezing-point* of water and the melting-point of ice, as Professor Tyndall remarks, touch each other as it were.

II. n. 1. The language spoken by the peo-
ple of France. French is parallel with Provencal,
Spanish, Portuguese, Italian, Wallachian, and minor dia-
lects, called together the *Romanic languages*, being de-
scended from the Latin as spoken by the Romans and the
peoples of the various provinces whom they brought un-
der their dominion, mingled with the Celtic and Teutonic
tongues with which Latin was thus brought in contact.
(See *Romanic*.) *French* means 'the language of the Franks,'
a Teutonic people merged with the mixed races of Gaul,
who received the Frankish name (the country being thence
called *France*), but retained their Romanic speech, the
Franks and other Teutonic tribes, and later the Northmen,
accepting the speech of the people they conquered. It is
divided chronologically into *Old French* and *modern
French*, the former extending from the ninth century to
the fourteenth, or, with the convenient inclusion (as usual-
ly in this dictionary) of what is specifically called *Middle
French*, to the sixteenth century. Old French existed in
many dialects, the phrase, indeed, when unqualified or
undiscriminated, including the aggregate of such dia-
lects. The most important were the dialect of the Ile de
France, which, as the "French of Paris," has become the
modern literary French; and that of Normandy, the *Nor-
man* or *Norman French*, which, transferred to England
at the Conquest and there developed (as Anglo-French),
gave much to and took much from the English, and was
finally displaced by the mixed English speech thus formed.
(See *English*.) By later borrowing from French, or from
the Latin on the French model, the Romanic part of the
English vocabulary is now to a great extent nearly iden-
tical with that of French. As the most central and highly
developed of the Romanic dialects, French began, in the
sixteenth and seventeenth centuries, to take the place of
Latin as the general language of diplomacy, polite society,
and commerce. Its importance in this respect has much
diminished in the present century. It is now drawn upon
by other languages chiefly for terms of fine art, dress, and
cooking. The use of accents as a customary part of French
orthography began in the seventeenth century; they now
form a rigid artificial system, often a guide to pronuncia-
tion, and reflecting generally, but with numerous excep-
tions, previous etymological conditions of the words con-
cerned. Regarded as a Romance language, French is re-
markable for its departure from the Latin type. In its
vowel and consonant system (notably in its nasal vowels),
its sweeping contractions, and its general destruction of
final sounds or syllables, with the retention in many cases
of these lost sounds in spelling, it differs markedly from
other Romance tongues.

2. A method of painting on walls covered with a ground or coat of plaster or mortar, with which the colors become permanently incorporated if properly chosen and applied; also, a picture or design so painted. *True fresco* (Italian *buon fresco*) is painting in colors mixed with water or hydrate of lime upon a wet surface of mortar made of lime and pure quartz-sand. In this method earth pigments are chiefly used, because all vegetable and many mineral pigments are decomposed by lime or altered by light. The solidity of the painting depends upon the penetration of the colors into the plaster or mortar, and upon the crystalline layer which forms upon its surface before the mortar has set, as it does in a few hours through the absorption of carbonic acid from the atmosphere. If this crystalline layer is disturbed, or if it has begun to form while the artist is painting, or if it forms between the thinner and thicker coats of color successively applied, the colors will flake and fall away. *Dry fresco* (Italian *fresco secco*) is a method of fresco-painting upon a dry surface. The last coat of plaster, or intonaco, when perfectly dry, is rubbed with pumice-stone, and well wetted with water and a little lime the evening before painting, and again immediately before the artist begins work. The first step in this process is to pounce the outline of the design upon the wall. The phrase *fresco secco* is applied also to retouching in distemper. The implements used by fresco-painters include wooden and glass floats, trowels of wood and iron, palette-knives of steel and bone, a trimming-knife, a bone or ivory stylus, and brushes of hog-bristles and other hair, of such quality as to be neither curled nor burned by lime. Compare *distemper*.

It is a very common error to term the ancient paintings found on church walls, &c., *fresco*, but there is scarcely an instance of a genuine *fresco* among them. They are distemper paintings on plaster, and quite distinct in their style, durability, and mode of manipulation. *Fairholt*.

With *friections* of her fleece.

Cowper, Mischievous Bull.

2. In *mech.*, the resistance to the relative motion, sliding or rolling, of surfaces of bodies in contact: called in the former case *sliding*, in the latter *rolling friction*. It is partly due to the adhesion of bodies, but the greater part of it is the result of their roughness. The friction proper is independent of the velocity and of the area of contact; it depends solely upon the nature of the two surfaces and upon the pressure upon them, to which it is directly proportional. What is sometimes called the *internal friction* of fluids is *viscosity* (which see). The friction of a fluid upon a solid is considerable; it is now recognized as an important factor in the designing of ships.

3. Figuratively, lack of harmony; mutual irritation; worrying; difficulty.

Many causes, and among them that personal *friction* which is the despair of all who would make history a science, had produced among the peasantry such intensity of hatred to their lord that they were ready to find allies against him anywhere.

friction-balls (frik'shon-bālz), *n. pl.* Balls placed under a heavy object to reduce the friction while that object is moving horizontally. Some forms of swing-bridges have such balls placed under them.

friction-breccia (frik'shon-breeh'ia), *n.* In *geol.*, angular or sometimes imperfectly rounded fragments of rock filling more or less completely the cavity left between the sides or walls of a fault or fissure. This material may have been torn from the walls as one of the results of the violent motion to which the rock was subjected at the time the fissure originated, or it may have fallen in from above after the cavity had been formed. Mineral veins are not infrequently made up in considerable part of brecciated material derived from the rubbing together and crushing of the adjacent rock. Large masses of rock thus occurring in a vein are called *horres*. Friction-breccia is also sometimes called *fault-rock*. See *vein* and *horre*.

friction-card (frik'shon-kārd), *n.* The diagram produced by the indicator of a steam-engine when it is applied to exhibit graphically the power of an engine working without load.

friction-clutch (frik'shon-kluch), *n.* In *mach.*, a form of friction-coupling.

friction-cones (frik'shon-kōnz), *n. pl.* In *mach.*, a form of friction-coupling consisting of two cones, one of which is fitted into the other and communicates its motion to it by means of the friction between the two surfaces. See *friction-coupling*.

Friction-cones.
a and b, cones; c, fork.

friction-coupling (frik'shon-kup'ing), *n.* In *mach.*, a device for conveying motion from one line of shafting to another by the frictional contact of cones, expanding toggles, and clutches of various forms. In all these appliances a sleeve sliding on one of the shafts and turning with it may be advanced or drawn back at will to bring the parts into action. In the friction-cone coupling a conical disk is pushed at will into a hollow cone, the two surfaces fitting closely together, and either, when in motion, imparting its motion to the other by friction. In other friction-couplings the sliding sleeve causes a pair of toggles to expand against the inner rim of an idle pulley, and by their contact to impart to it their motion; or the movement of sliding levers over a cone causes two pulleys to be drawn together into frictional contact, or causes two disks to press one against the other. In all these couplings the object sought is

Friction-coupling.

to connect parts of a line of shafting by frictional contact instead of direct contact, as in a geared wheel, and to obtain the same advantages in a coupling that are found in friction-gearing.

friction-gear (frik'shon-gēr), *n.* Same as *friction-gearing*.

friction-gearing (frik'shon-gēr'ing), *n.* A method or system of imparting the motion of one wheel or pulley to another by simple contact. The advantages of this kind of gearing are threefold: it enables the parts of a machine to be thrown quickly into or out of play; it gives a variable speed or power; and it prevents the injury caused by a breakage or stoppage from extending from one part of the mechanism to another or from the machine to the motor. The most simple form of friction-gearing is a pair of wheels with thin faces, which may be covered with leather, a fabric, or other elastic material, in more or less close contact. In some such wheels the faces are grooved, or the wheels are cone-shaped and placed at a right angle and with grooves cut on the faces. In others a collar on a shaft may carry pivoted arms which if turned one way press against the inner face of a wheel, and if turned the other way fall back out of contact and cease to impart their motion. In other forms one wheel revolves within another, contact being assured by means of springs. If the resistance overcomes the springs the contact is destroyed and motion is no longer imparted. Variable speed and reversal of direction are also secured by causing a friction-wheel placed at right angles with a disk and against

Friction-gearing, grooved.

it to move from the rim toward the center or past the center of the disk, as in the feed-motion of some forms of gang-saws.

frictionless (frik'shon-less), *a.* [*< friction + -less.*] Without friction.

Were water absolutely *frictionless*, an incline, however small, would be sufficient to produce a surface-flow from the equator to the poles.

J. Croll, *Climatic and Time*, p. 220.

The joints and bearings of all the levers are made *frictionless* by using flexible steel connecting plates instead of knife-edges. *Encyc. Brit.*, XXII, 597.

friction-match (frik'shon-mach), *n.* A match tipped with a compound which ignites by friction: the usual form of match in domestic use. The first chemical matches were invented in Paris in 1805; and soon after 1827, when the composition of friction-matches was much improved by an English chemist, they came into general use, superseding the various applications of the flint and steel which had until then been relied on.

friction-plate (frik'shon-plāt), *n.* 1. A metal plate attached to any surface to prevent abrasion or resist friction.—2. A plate used in connection with a clamp to check the recoil of a gun-carriage.

friction-powder (frik'shon-pou'dēr), *n.* A composition of chlorate of potash and antimony, which readily ignites by friction.

friction-primer (frik'shon-pri'mēr), *n.* A friction-tube. [*U. S.*]

friction-sound (frik'shon-sound), *n.* In *pathol.*, the sound perceived on auscultation of serous surfaces which rub together when through disease they are roughened or not well lubricated.

friction-tight (frik'shon-tit), *a.* In *mach.*, fitting so tightly or closely that a desired effect of friction is produced. Noting—(a) A mechanical fit, joint, or union between the surfaces of two assembled parts so close that any motion given to one part will be transmitted to the other without slipping, as a contact between two curved surfaces so perfect that their reciprocal pressure is sufficient to transmit any motion of rotation applied to one to the other without the interposition of any locking device, as a key, gib, splice, screw-thread, set-screw, or polygonal surface. (b) A close fit produced by a pressure sufficient to retain a part in its position when acted upon by its weight alone.

friction-tube (frik'shon-tüb), *n.* *Milit.*, a tube used in firing cannon, sufficient heat being generated in it by friction to ignite friction-powder. [*Eng.*] Called *friction-primer* in the United States service.

friction-wheel (frik'shon-hwēl), *n.* In *mach.*: (a) A form of slip-coupling applied in cases where the variations of load are sudden and great, as in dredging-machinery, etc. In the form illustrated a strong pulley, *B*, is keyed on the driving-shaft, and on the circumference of this a wheel, *A*, is fitted, with a series of friction-plates, *a, a, a*, interposed, and retained in recesses formed in the eye of the wheel. Behind each of these plates a set-screw, *b*, is inserted, which bears against the back of the plate, and can be tightened at pleasure to regulate the degree of friction required for the ordinary work; but should the pressure on the circumference of the wheel *A* exceed this, the plates slide upon the circumference of the pulley *B*, which continues to revolve with the shaft, and the wheel itself remains stationary. (b) One of two simple wheels or cylinders intended to assist in diminishing the friction of a horizontal axis. The wheels are simply plain cylinders, carried on parallel and independent axes. They are disposed so as to overlap pair and pair at each end of the main axis, which rests in the angles thus formed by the circumferences. The axis, instead of sliding on a fixed surface, as in ordinary cases, carries around the circumferences of the wheels on which it is supported with the same velocity as it possesses itself, and in consequence the friction of the system is proportionally lessened.

Friction-wheel.

A late improvement in what are called *friction-wheels* . . . consists of a mechanism so ordered as to be regularly dropping oil into a box which encloses the axis, the nave, and certain balls upon which the nave revolves. *Paley*, *Nat. Theol.*, viii.

Friday is the Mohammedan sabbath or "day of assembly." It is said in the Mohammedan traditions to have been established by divine command as a day of worship for Jew and Christian alike, as being the day on which Adam was created and received into Paradise, the day on which he was expelled from it, the day on which he repented, and the day on which he died. It will, according to the same traditions, be the day of the resurrection. In the Roman and Eastern and Anglican churches, all Fridays except Christmas day (when it occurs on Friday) are generally observed as fasts of obligation or days of abstinence, in memory of the crucifixion of Christ, an event which is more especially commemorated annually on Good Friday (see below). In most Christian nations Friday is popularly regarded with superstition, and is considered an unlucky day for beginning any enterprise; to spill more or less salt on Friday is considered an especially bad omen. Until recently it was common for criminals under sentence of capital punishment to be executed on Friday; hence Friday is sometimes called *hangman's day*.

(b) Any Friday marked by a great calamity: with special reference in England to Friday, December 6th, 1745, the day on which news reached London that the young pretender Charles Edward had reached Derby; or to the commercial panic caused by the failure of the house of Overend and Gurney, May 11th, 1866; and in the United States to the sudden financial panic and ruin caused by reckless speculation in gold on the exchange in the city of New York on Friday, September 24th, 1869; or to another similar panic there, which began September 18th, 1873.—**Golden Friday.** (a) The Friday in each of the ember-weeks. *F. Good Friday, the Friday before Easter, a holy day of the Christian church, in memory of Christ's crucifixion, of which this day is taken as the anniversary. The early church observed it as a strict fast; in the church services doxologies were omitted, no music except the most plaintive was allowed, and the altars were stripped and draped in black. At present, in the Greek and Roman (Catholic) churches, Good Friday is a solemn fast; and it is also observed with special services and prayers by the Church of England, and the Protestant Episcopal Church in the United States, and by the Lutherans, German Reformed Church, Moravians, and many Methodists.

Alien friend, a foreigner whose country is at peace with one's own.—**Friends of God**, a name assumed by an unorganized brotherhood of German mystics existing in the fourteenth century, who, in opposition to the formalism and ecclesiasticism of their age, emphasized the possibility and duty of complete self-renunciation and intimate spiritual union with God. Prominent among the leaders were Nicholas of Basel and John Tauler. As they were not bound together by either an ecclesiastical organization or a common creed, their views of religious truth differed, and some of their utterances gave rise to charges of pantheism and antinomianism.—**Friends of Light, Protestant Friends**. See *Free Congregations*, under *congregation*.—**Next friend** (Law *F. prochein amy* or *ami*), in law: (a) In some jurisdictions, a person by whom an infant or a married woman sues, and who is responsible for costs. (b) In *Scottish* law, a tutor or curator.—**Progressive Friends**, a religious society first formed in 1853 in Pennsylvania, rationalistic in its theological tendencies, but disclaiming the binding obligation of creeds and the exercise of disciplinary authority.—**Society of Friends**, the proper designation of a Christian sect commonly called Quakers, which took its rise in England about the middle of the seventeenth century through the preaching of George Fox. A division occurred in portions of the society in America in 1827, through the preaching of Elias Hicks, whose followers, commonly called *Hicksites*, hold doctrinal views closely approximating those of the Unitarians, while in church government and other respects they retain the

usages of the orthodox Friends. The latter agree doctrinally with other evangelical Christians, but lay greater stress on the doctrine of the personal presence and guidance of the Holy Spirit. They have no paid ministry, and accept the ordinances of baptism and the Lord's supper in a spiritual sense only, rejecting their outward observance as church rites. They condemn all oath-taking and all war. The organization of the Society involves four periodical gatherings called "meetings": namely, preparative meeting, monthly meeting, quarterly meeting, and yearly meeting. The body called the Yearly Meeting has supreme legislative power. There are two Yearly Meetings in Great Britain, one in Canada, and ten in the United States.—**To be friends with**, to be in a relation of mutual or reciprocal friendship with.

The proper AS. form is **frithborh*, < *frith*, peace, + *borh*, a pledge (> E. *borrow*, *n.*). Cf. *frithsoken* and *frank-pledge*.] In Anglo-Saxon law, one of the tithings or groups of ten men into which the hundred was divided, the members of each one being held liable for the misdeeds of a fellow-member.

Strong as the crown might be, its strength lay in the king's personal action, and it was far from possessing any adequate police or judicial machinery for carrying its will into effect. To supply such a machinery was the aim of the *frith-gilds*.

J. R. Green, *Conq. of Eng.*, p. 219.

frithsoken (frith'sō-ken), *n.* [Also *frithsoene*, *frithsoen*, *frithsoca*; ME. *frithsoene*, "franchise de franc plege" (Rel. In Anglo-Saxon law, the franchise or governmental power of requiring the people to keep the peace; the jurisdiction to punish for breaches of the peace. This power was profitable by reason of the fines and forfeitures resulting from its exercise; consequently it was often conferred in the charters and royal grants of early English history, beginning in the later part of the Anglo-Saxon period, about the time of Edward the Confessor. (See *soc*.) The Normans, it is supposed, by confusing the Anglo-Saxon *frith* with *fre*, *fri*, modern *free*, adopted the term *frank-pledge* to designate the binding of persons to be peculiarly responsible for one another's peaceable conduct.

Athelstan his son succeeded King Edward, being much devoted to St. John of Beverley, on whose church he bestowed a *freed-stool* with large privileges belonging therunto.

Fuller, Church Hist., II. v. 9.

Such a privilege (the right of sanctuary or refuge for criminals) was given by allowing what was called the *Frithstool* to be set up in some part of the hallowed building. This "stool of peace," for such is the meaning of the word, was a low-backed arm-chair, made of stone. Its standing-place was either near the high altar, or by the side of the patron saint's shrine. From this spot, as from a center, the *frithstool* spread its privilege of sanctuary over land and water all about the minister which held it, to the distance of at least a mile.

Of the true frogs there are about 250 species, belonging to 18 genera, common in most parts of the world except the Neotropical and Austrogean regions, including for the most part aquatic or arboreal batrachians, distinguished by their agility and symmetry, as well as by their webbed toes, from the related batrachians which are popularly named *toads*; but the distinction is not always preserved. Of the genus *Rana* alone there are upward of 110 species, most of which are aquatic, are expert swimmers, and capable of making very long leaps; some are terrestrial, and some arboreal. Several different kinds of frogs are edible, as the common European *R. esculenta*. The largest species is the bullfrog of the United States, *R. catesbeiana*. (See *bullfrog*, and cuts under *Anura* and *Rana*.) Others of the same country are *R. palustris*, *R. hulaeana*, and *R. clamata*. The toes of some arboreal frogs are enormously lengthened and fully webbed, enabling the creatures to make long flying leaps. (See *flying-frog*, *Rhacophorus*.) Some have the ends of the toes dilated, like many of the toads. The tongue of most true frogs is emarginate behind, with a process on each side. Most frogs deposit their spawn in masses in the water, and the young hatch from the egg as tadpoles, provided with a tail and external gills, which disappear with the growth of the permanent limbs. The arboreal batrachians known indifferently as *tree-frogs* or *tree-toads* are not frogs in any proper sense, but belong to a different suborder (*Arretera*) of salient amphibians. (See *Hylidae*.) The name *frog* is loosely applied, with or without a qualifying term, to some other batrachians equally remote from the *Ranidae*, and locally in the United States to certain lizards. The fresh-cut fruit is laid on the lower tray next the furnace. When full it is raised by means of the chains, and another tray of fruit is put in. By this arrangement the steam from the fresh fruit rises to the trays above, keeping the fruit bathed in steaming vapor. fugue (fūg), *n.* [F., < It. *fuga*, also *fugga*, a flight, a fugue, < L. *fuga*, a flight, < *fugere*, flee; see *fugitive*.] In music, a polyphonic composition based upon one, two, or even more themes, which are enunciated by the several voices or parts in turn, subjected to various kinds of contrapuntal treatment, and gradually built up into a complex form having somewhat distinct divisions or stages of development and a marked climax at the end. The most general divisions of a fugue are the exposition, the development, and the conclusion. A *strict fugue* is one in which each division is developed symmetrically and in a purely contrapuntal manner; while a *free fugue* is one that is irregular or incomplete in plan or detail. (a) In the *exposition*, the first voice enunciates the theme alone (subject, *dux*, antecedent) in the tonic key; the second voice then enunciates it (answer, comes, consequent) in the dominant key, sometimes with slight alterations; the third voice then imitates the first at the octave (usually); the fourth voice imitates the second in the same way; and so on, until all the voices, if there are more than four, have entered with the theme. The earlier voices usually accompany the later ones as they enter; and the melody added by the first voice to the answer in the second is often contrived in double counterpoint with it, so as to serve throughout the fugue as a counter-subject or foil for the original theme. The character of the theme gives the name to the fugue; a *diatonic fugue* having a diatonic subject, a *chromatic fugue* a chromatic subject, a *Doric fugue* a subject in the Doric mode, etc.: the character of the subject generally determines the character of the development. A *real fugue* is one in which the answer imitates the subject, note for note, usually at the fifth or fourth; while a *tonal fugue* is one in which the answer contains such slight alterations of the subject as shall adjust it exactly to its different tonality. A *fugue by inversion* is one whose answer is the inversion of the subject; so *fugue by augmentation*, by *diminution*, at the *sixth*, etc. The order in which the voices shall enter, and the exact relations of the answer to the subject, are both regulated by rules. A *double fugue* has two subjects, a *triple fugue* three subjects, etc. A *fugue in two parts* is one for two voices only, etc. A free part is sometimes added to those essential to the contrapuntal development of the fugue.

(b) In the *development*, the subjects, answers, and counter-subjects are used repeatedly, either wholly or in part, in different keys, under varying treatment, so as to unfold their entire contrapuntal capacity. The successive sections should have an increasing contrapuntal interest and intricacy, and should be closely bound together; though episodes or diversions from the orderly treatment of the principal themes may be inserted between the sections for contrast. (c) In the *conclusion*, the theme is

usually presented by all the voices in turn, as in the exposition, but frequently so rapidly that the entries overlap. Such an overlapping section is called the *stretto*. In connection with this, and usually as the final section, a pedal point is often introduced. The fugue is the consummate form of the polyphonic style of composition, requiring for its successful production a mastery of all the devices of counterpoint, as well as a very high grade of inventive and constructive genius. The greatest writers of fugues are J. S. Bach (1685-1750) and G. F. Handel (1685-1759).

His volant touch
Instinct through all proportions, low and high,
Fled and pursued transverse the resonant fugue.

Fulgora (ful'gō-rā), *n.* [NL., *< L. Fulgora*, a goddess of lightning, *< fulgor*, lightning: see *fulgor*.] A genus of homopterous insects, giving name to the family *Fulgoridæ*; the lantern-flies. They are remarkable for the prolongation of the forehead into an empty vesicular expansion, and are so named because it has been asserted that the lantern-fly proper (*F. lanternaria*), a native of Guiana, emits a strong light from this inflated projection. The evidence of this luminosity, however, is more than doubtful. A Chinese species has, on equally equivocal testimony, been called *F. candelaria*. *See lantern-fly*.

Fulgoridæ (ful-gor'i-dā), *n. pl.* [NL., *< Fulgora + -idæ*.] The lantern-flies proper; the *Fulgoridæ* in a restricted sense, or a subfamily of *Fulgoridæ* in a broad sense.

The family *Fulgoridæ* is distinguished by the presence of the great lantern-flies, and includes also a host of other species of very diverse forms and of many varieties of structure. It contains forms which might have been mistaken for butterflies and moths, and others which closely

They may be recognized by the compressed, vertical, often carinated face, and by the bristle-shaped antennæ being set into a button-shaped base on the sides of the cheeks beneath the round eyes, and below which latter a small ocellus appears. The wing-covers are generally opaque, and narrower than the wings. . . . The family is now divided into thirteen subfamilies. *Stand. Nat. Hist.*, 11. 229.

They have a pear-shaped shell with a long anterior canal and a single fold around the base of the columella. The most common species are *Fulgur carica* and *Sycotypus canaliculatus*.

fulgurite (ful'gū-rīt), *n.* [*L. fulgur*, lightning, + *-ite*².] A tube formed, usually in loose sand, but sometimes in the solid rock, by lightning; a lightning-tube. Fulgurites are the result of the passage of the electric current through the soil, sand, or rock, producing more or less complete fusion in the vicinity of the path traversed. They usually descend vertically, but sometimes obliquely, and they occasionally branch toward the bottom. They are rarely more than one or two inches in diameter. The effect of lightning is sometimes seen, and occasionally on a large scale, where no proper fulgurites have been found, but rather a sort of honeycombed condition of the rock, resembling that produced in wood by the boring of the teredo, as observed on Little Ararat, and described by Abich. For the rock (andesite) thus vitrified and altered this geologist proposes the name *fulgurite andesite*.

fulgurous (ful'gū-rus), *a.* [*L. fulgur*, lightning, + *-ous*.] Lightning-like; appearing or acting like lightning.

There are about 10 species, of most parts of the world. The common European coot is *Fulica atra*; that of the United States is *F. americana*. (See *coot*.) It has been given to all the sea-ducks excepting the eiders, but is now usually restricted to such species as the pochards and scaups, or redheads and blackheads. The common pochard is *F. ferina*. The scaup is often called *F. marila*. Many generic names of sea-ducks, as *Fulix*, *Aithya*, etc., are partial synonyms of *Fuligula*. See *cut* under *scaup*.

The characters otherwise are much as in *Anatidæ*, but the feet are usually larger in proportion, with relatively shorter tarsi, longer toes, and broader webs; they are also placed further back, impeding locomotion on land, but increasing swimming powers. The species are usually good divers, and they feed upon animal food to a greater extent than river-ducks. They are by no means exclusively marine or maritime. The pochards, scaups, canvasbacks, goldeneyes, long-tailed and harlequin ducks, scoters, eiders, etc., all belong to this subfamily.

upper mandible. It inhabits the northern seas in prodigious numbers, breeding in Iceland, Greenland, Spitzbergen, the Shetland and Orkney Islands, the Hebrides, etc. It feeds on fish, the blubber of whales, and any fat, putrid, floating substance that comes in its way. The very idea of an organ is that of an apparatus for the doing of some definite work, which is its *function*.

Argyll, *Nineteenth Century*, XXIII. 152.

The normal operations of each of these faculties are called its *functions*. The term is taken from the action of the bodily organs. From these it is transferred to organs in the metaphysical sense, as the "organs of government," and the *functions* which they perform. In both these applications it has come to mean, first, the appropriate operations of each, and then the activities to which they are appointed, set apart, or destined.

N. Porter, *Human Intellect*, § 37.

6. In *math.*, a mathematical quantity whose value depends upon the values of other quantities, called the arguments or independent variables of the function; a mathematical quantity whose changes of value depend on those of other quantities called its variables. Thus, if the diameter of a circle be conceived to vary in length, the length of the circumference will also vary with it, in accordance with a fixed geometrical law, and is therefore a function of the diameter, the latter being regarded as the independent variable. So in the equation $y = ax + b$, if x be conceived to vary independently, y will be its function, since its value will vary with each successive value of x . The common algebraic notation is $y = f(x)$, to be read " y is a function of x ." F , ϕ , and other letters are often used in place of f . It is not the special value of fx , but this quantity considered as variable and as depending upon x , which is called the *function*. It is even called the same *function* irrespective of the special values of certain parameters upon which it may depend, and which are considered not as variables, but as constants. The earlier analysts used *function* to mean merely a power, or continued product of a quantity into itself. The present mathematical meaning first appears in the Latin correspondence between Leibnitz and John Bernoulli. Mathematical usage is not precisely settled as to the meaning, and this in two respects. First, as some writers use the word, the possible values of the function depend upon the values of the variables; so that, if y is a function of x , there must be some value which y can take for some value of x , which it cannot take for some other value of x . But other writers hold that two quantities which are functions of a third are functions of each other. For example, if $x = \tan t$ and $y = \tan(t/2) + i \tan(t/3)$, they hold that y is a function of x , although it can take every value for every value of x ; for there is even here a connection between the values of x and y , so that in the course of any continuous change of x the mode of change of y is somewhat restricted. Secondly, according to the usage of Cauchy and his followers, if an imaginary quantity, $X + Yi$, be so connected with another, $x + yi$, that X and Y are each of them functions of x and y , say $X = F(x, y)$ and $Y = f(x, y)$, then the former imaginary is a function of the other; but the majority of mathematicians have restricted the name *function* to what the school of Cauchy would term monogenous and differentiable functions, although such a restriction is impossible where the variable does not vary continuously. The tendency of recent writers is to give the greatest possible breadth to the application of the term.

Walpole, *Letters*, II. 130.

Post fund, in the United States army, the savings from the allowance of flour at a post bakery, used to defray the expenses of the bakery, for the purchase of garden-seeds, and for the support of post schools, etc.—**Public funds**, securities issued by a government in return for loans, at a fixed rate of interest, and usually for a definite term of years, in the form of negotiable or transferable bonds of different amounts. Often called simply the funds.—**Regimental fund**, in the United States army, 50 per cent. of the post fund, after deducting the expenses of the bakery, divided pro rata among the regiments represented by companies at the post, and paid over to the several regimental treasurers for the maintenance of the bands.—**Sinking-fund**, a fund formed by a government or corporation for the gradual "sinking," wiping out, or reduction of its debt, by various devices for the accumulation of money. (See *fund¹*, v. 2, end.) The first sinking-fund was established by Sir Robert Walpole in England in 1716.

—The funds, originally, in Great Britain, the product of particular taxes, as customs, excise, stamp, etc., pledged by the government for the payment of particular loans and the interest on the same; now, the national or public debt, or the stocks which represent it; as, to have money in the funds. See *consols*, and *consolidated funds* (under *consolidated*).

fund¹ (fund), v. t. [*< fund¹*, n.] 1. To collect and accumulate; store. [Rare.]

De Quincey, *Herodotus*.

2. To convert (a floating debt) into capital or stock, or into a more or less permanent debt, represented by bonds for definite sums, bearing interest at a fixed rate, and commonly redeemable within a fixed period of years. That part of the indebtedness of a government or corporation which is payable immediately or soon, so that early provision for payment must be made or forbearance obtained, is called the *floating debt*. To fund such an indebtedness is to cancel it by inducing the creditor to take in its place obligations having considerable time to run, and issued, in convenient portions or shares, in the form of interest-bearing bonds or certificates available to the holder as marketable securities; or by procuring a fresh loan on the issue of such obligations, and using the proceeds to pay off the floating indebtedness. To refund a debt is to repeat this process when the time obtained by the funding expires. The funded debt of a body politic or corporate is the aggregate of the debt thus provided for. It is approximately the same in amount as the old debt, unless it is increased, as is often the case, by including in it the expenses of funding, or by issuing the obligations below par. The funded debts of governments are spoken of as the *public funds*, and the securities issued are spoken of as *stocks* or *bonds*. Such securities, when issued by corporations, are usually spoken of in the United States as *bonds* (the word *stocks* being applied to shares, which do not represent the debt of a corporation, but ownership in it), and in Great Britain as *bonds* or *debentures*. With the funding of a debt is frequently coupled the creation of a sinking-fund for its redemption. See *sinking-fund*, under *fund¹*, n.

fung-hwang, fēng-hwang (fung'hwāng'), *n.* [Chinese.] In Chinese myth., a fabulous bird of good omen said to appear when a sage is about to ascend the throne, or when right principles are about to triumph throughout the empire. It is usually called the Chinese phoenix, but seems, from the descriptions of it found in books, to resemble the Argus pheasant. It has not appeared since the days of Confucius. It is frequently represented on Chinese and Japanese porcelains and other works of art. *Fung* is the name of the male bird, and *hwang* of the female.

The *fung-hwang* of Chinese legends is a sort of pheasant, adorned with every color, and combining in its form and motions whatever is elegant and graceful, as well as possessing such a benevolent disposition that it will not peck or injure living insects, nor tread on growing herbs.

S. W. Williams, Middle Kingdom, l. 266.

Fungi (fun'ji), *n. pl.* [L., pl. of *fungus*, a mushroom: see *fungus*.] One of the lowest of the great groups of cellular cryptogams. The *Fungi* are chiefly distinguished by the absence of chlorophyll, and therefore by the lack of power to assimilate inorganic substances, being thus dependent for their food upon living or dead organic matter obtained from other plants or from animals. Consequently, also, they do not inhale carbonic acid and give off oxygen as chlorophyllous plants do in assimilation, but do inhale oxygen and give off carbonic acid as other plants do in respiration. The vegetative system consists of filiform cells, called *hyphæ*, and the hyphæ of a fungus taken collectively are called the *mycelium*. The hyphæ are usually septate and branched; in some fungi, as *Pezizomycetes* and their allies, there are no septa except those which divide off the propagative cells or organs. Exceptions to the hyphal plan of structure occur in several cases. In the yeast-fungi and yeast-like stages of certain other fungi the plant consists of a succession of ellipsoidal cells formed by budding; in the *Chytridiæ* certain species have no mycelium, but consist of a spherical or ovoid cell; in the bacteria the prevailing form is that of very minute spheres or rods, which multiply by fission; in the vegetative stage of the *Mycetozoa* there is only a mass of protoplasm. The mycelium is said to be *filamentous* when the hyphæ are separate, or at most but loosely interwoven, as in the common molds; *membranous* when the hyphæ are so interwoven as to form a layer; *fibrous* when the hyphæ form branching strands, the latter being often of considerable size and indurated. In some groups, as the mushrooms, the interwoven hyphæ form a compound fungus-body of definite and regular shape. *Fungi* are sa-

phytic or parasitic, according as that from which they obtain their food is a dead organic substance or a living organism. Some parasitic species are facultative saprophytes, and some saprophytic species are facultative parasites. Among the saprophytic fungi are the common domestic molds and mildews, the "dry-rot" fungi, the greater number of ascomycetous and basidiomycetous fungi, which grow on dead wood, leaves, etc., or organic matter in the soil, also many *Hyphomycetes*, and the *Mycetozoa*. Among the parasitic fungi are the *Uredineæ* or rusts and *Ustilagineæ* or smuts, which grow upon wild and cultivated plants, also most *Peronosporæ*, as represented by the potato-rot and American grape-vine mildew. Among the *Ascomycetes*, the *Erysiphææ* (powdery mildews) are all parasitic, as are also many other *Pyrenomycetes* and a few *Discomycetes*. Many parasitic species, especially the rusts, smuts, and mildews, cause great destruction to cultivated crops. The lichens are now considered by many botanists to consist of fungi parasitic upon algae (the gonidia). (See *lichen*.) A few fungi grow upon living animals and man. Several species of *Aspergillus* cause a disease (otomycosis) of the human ear. Other fungi produce the skin-diseases favus and ringworm. Bacteria are believed to cause most or all of the fevers and contagious diseases of man and the lower animals. Species of *Saprolegnia* cause epidemics among fishes, especially the salmon. The principal parasites upon insects belong to the *Entomophthoræ* and the genus *Cordyceps*. (See cut under *Cordyceps*.) Silkworms are attacked by a species of *Botrytis*, and bacteria cause epidemics among silkworms and other insects. Both sexual and asexual reproduction occur in fungi; the latter is present in all, and in many is the only kind that has been observed. The asexual spores (conidia) are most frequently produced upon the tips of uninclosed hyphæ, as in *Hyphomycetes*, or on short hyphæ produced in conceptacles, but sometimes by free cell-formation, as in *Mucor*. The sexual organs are of three types. In the conjugating fungi, *Mucor* and its allies, reproduction takes place by the union of two similar cells to form a zygospore. In *Peronospora* and its allies oogonia and antheridia are formed; the antheridium comes in direct contact with the oogonium, and a transfer of the protoplasm into the oosphere takes place. In the *Ascomycetes*, so far as known, a carpoconium takes the place of the oogonium, and the product of fertilization is usually a perithecium or apothecium containing asci and spores. (See *Eurotium*.) Modern classifications of fungi are of two kinds. That proposed by F. Cohn in 1872 classes together in primary groups fungi and algae having similar modes of reproduction, employing the peculiar fungal characters in distinguishing the secondary groups; but the usual method recognizes fungi as wholly distinct from algae, separated by physiological and morphological characters, in this respect agreeing with the old method. The artificial system formerly in use and still retained in some English books divides the fungi into the orders *Ascomycetes*, *Phycomycetes*, *Hyphomycetes*, *Coniomycetes*, *Gasteromycetes*, and *Hymenomycetes*. De Bary in 1861 made four divisions: *Phycomycetes*, *Hypodermiæ*, *Basidiomycetes*, and *Ascomycetes*. Goebel (1882) does not include *Mycetozoa* and *Schizomycetes* under *Fungi* proper; the latter he divides into *Chytridiaceæ*, *Ustilagineæ*, *Phycomycetes*, *Ascomycetes*, *Uredineæ*, and *Basidiomycetes*. The *Fungi Imperfecti* of modern authors include a large number of forms, of which some are known, and most are suspected, to be the asexual stages of *Ascomycetes*. The principal groups of *Fungi Imperfecti* are the *Sphaeropsideæ*, *Melanconia*, and *Hyphomycetes*. The number of known species of fungi is estimated at about 30,000. Most of the edible fungi are found among the mushrooms and puffballs; but the truffle and morel are ascomycetous. Most of the species recognized as poisonous are mushrooms; but the ergot-fungus is ascomycetous. Some smuts are poisonous to cattle. Some fungi produce poisonous substances, as alcohol, by fermentation. Also called *Fungales*. See cuts under *ascus*, *basidium*, *Clavaria*, *ergot*, *exoperidium*, *Fusidium*, and *Puccinia*.

Fungia (fun'ji-ā), *n.* [NL., < L. *fungus*, a mushroom: see *fungus*.] The typical genus of mushroom-corals of the family *Fungiidae*. Lamarck, 1801. See cut under *coral*.

Fungia . . . is the largest of the solitary lime-secreting corals, and often reaches a diameter of from six to eight inches. It is disk-shaped, with a large number of radiating partitions which extend from the center to a periphery not bounded by a vertical wall. The tentacles . . . are irregularly disposed over its whole upper surface. *Fungia* in its adult condition is not attached to the ground, but lies in the coral lagoons in rather sheltered places.

It has always been largely used for human clothing, either on the skin or separated from it. stadium), prop. the length of a furrow, or the drive of the plow before it is turned, *< furl*, a furrow, + *lung*, long. The length of a furrow would ordinarily be equiv. to the length of the field; like other orig. indefinite terms of measure, the word came to have a definite value, being fixed by custom at 40 rods, and hence called in ML. (AL.) *quarentena*: see *quarantine*.] A measure of length equal to the eighth part of a mile, 40 rods, poles, or perches, 220 yards, or 201.17 meters. The furlong corresponds to the Roman stadium, and one eighth of any kind of mile is called a furlong in older writers. Thus, English writers of the sixteenth century often call 625 feet a furlong; and the reason is that 5 feet was taken to be a pace, so that a Roman mile of 1,000 paces would be 8 × 625 feet. So the eighth part of a Scotch mile, or nearly 742 feet, was a furlong. In the English translation of the New Testament *furlong* is used to translate the Greek *σταδιον*, stadium. Abbreviated *fur*.

furlough (fēr'lō), *n.* [The spelling *furlow* occurs in the 18th century, but *furlough* appears to be the earliest spelling (as in Blount's Gloss., ed. 1674). As the spelling *furlough* does not follow that of the orig. language, it was prob. intended to be phonetic (from a military point of view), the *gh* perhaps as *f* and the accent on the second syllable; *< D. forlof*, leave, furlough, = LG. *verlof* = G. dial. *verlaub* (these prob. of Scand. origin). *< Dan. forlor*, leave, permission, furlough, leave of absence, = Sw. *förlof*, leave, pardon; a form (with prefix *for-*, *für-* = E. *for-*) equiv. to the older Dan. *orlov*, leave of absence, furlough, = Sw. *orlov*, dismission, discharge, = Icel. *orlof*, leave, = D. *oorlof*, leave, = OHG. *irloubōn*, MHG. *erloben*, G. *erlauben* = AS. *ālŷfan*, *ālīfan* = Goth. *ustarbian*, leave, permit, *< Goth. us-* (= AS. *ā-* = OHG. *ar-*, *ir-*, unaccented; AS. *or-* = OHG. *ur-* = Icel. *or-*, accented) + **laubjan* (in comp.), leave: see *u-1*, *or-*, *for-1*, and *leave-1*, *v.* *Furlough* thus ult. contains the elements *for-1* and *leave-1*.] Leave of absence; especially, in military use, leave or license given by a commanding officer to an officer or a soldier to be absent from service for a certain time. In the United States army the term is used officially only for such leave given to an enlisted man, the same permission granted to a commissioned officer being designated a *leave of absence*. A soldier availing himself of the permission is said to be *furloughed*, or *on furlough*; an officer, on *leave*. The word is also used to designate the temporary discharge from service of a civilian in the employ of the government. In the United States navy it has a special signification, indicating the condition of an officer off duty either for fault or at his own request and only receiving one half of "waiting-orders pay."

After an absence of several years passed with his regiment, . . . he was now returned on a three years' furlough.

Furnaces are constructed in a great variety of ways, according to the different purposes to which they are to be applied. See *air-furnace*, *blast-furnace*, and *hearth*.

Base-burning furnace. See *base-burning*.—**Bone-black furnace.** See *bone-black*.—**Calcing-furnace**, a furnace in which the operation of calcing is performed; specifically, a reverberatory furnace, with a low arch, in which hard lead is "softened" by exposing it to the action of the flame, by which the foreign metals (antimony, copper, and iron) are oxidized, and collect on the surface of the metal in the form of dross. Also called *improving-furnace*, and the process of softening is also called *improving*.

—**Carbonizing-furnace.** See *carbonize*.—**Castilian furnace**, a circular furnace, usually about 3 feet in diameter and 8½ feet high, having a breast formed by a semicircular iron pan furnished with a lip for running off the slags and a longitudinal slot for convenience in tapping. On the top of this cylinder, which is made of fire-brick, rests a box-shaped covering of masonry supported by four pillars, and in this are the feeding-door and the outlet for the products of combustion. The blast is obtained by means of a fan, and there are three twyers. This furnace is used in Spain for smelting poor ores of lead as well as rich slags. It has also been introduced to a limited extent in England.

—**Catalan furnace or forge**, a furnace used in the French Pyrenees and in some parts of Spain for the manufacture of wrought-iron directly from the ore. It consists of a quadrangular hearth, made of some fire-resisting material, supported by one or more small arches, and built against the side of a wall like the ordinary blacksmith's forge. The blast is supplied by a peculiar kind of blowing-machine called a *trompe*, in which the current of air is produced by the falling of water through a vertical tube. See *blooming* and *forge*.—**Cementation-furnace.** See *converting-furnace*.—**Converting-furnace**, a form of furnace in which bar-iron is converted into steel by carburization (which see). It consists essentially of an oblong rectangular case, called the *chest* or *pot*, open at the top, and inclosed within an arched fire-brick chamber, with arched openings at each end, through which a man can enter. The fireplace is underneath, and that and the flues are so arranged that the chest can be uniformly heated to a high temperature. The whole is inclosed within a hollow cone of brickwork, open at the top, like a glass-furnace. Two such chests are ordinarily built side by side, space being left for flues between the adjacent walls.

—**Cupola blast-furnace**, the modern form of blast-furnace, resembling the cupola used for foundry purposes in being much less massive in construction than the old-fashioned blast-furnace, but at the same time of much greater size, the largest being over 100 feet in height and 25 in diameter across the bushes. The cupola blast-furnace is built of radiating brickwork, inclosed within a wrought-iron casing.—**Cupola furnace.** See *cupola-furnace*.—**Danks rotary furnace**, a peculiar form of puddling-furnace (see *puddle*) in which the chamber in which the puddling is effected is made to rotate during the operation. It is claimed that the Danks furnace is more effective in eliminating the phosphorus and sulphur than the ordinary form of puddling-furnace.—**Decomposing-furnace**, a furnace used in the conversion of common salt into sulphate of soda, aided by the action of sulphuric acid.—**Dumb furnace**, a ventilating-furnace placed at the foot of the up-cast shaft of a mine, and arranged in such a way that, while the dangerous gases are drawn away, they cannot come in contact with the fire.

—**Hardening-furnace**, in *hat-making*, a furnace in which the bodies of hats, folded in wet cloth, are laid upon an iron plate and hardened by the pressure of traversing-plates together with the heat and dampness.—**High furnace**, the ordinary blast-furnace; so called in literal translation from the French *haut fourneau*.—**Hydrocarbon-furnace**, a furnace in which a liquid fuel, as petroleum, is used.—**Muffle-furnace**, the small portable furnace in which is heated the muffle containing the cupels (see *cupel*) used in assaying gold and silver.—**Osmund furnace**, in *metal-working*, a primitive form of furnace formerly used in Sweden, and still in use in Finland, for reducing bog-

iron ore. The lining of the furnace is of refractory stone, surrounding this, with a considerable earth-packed space intervening, is a crib of wood. The blast is furnished by bellows worked by treadles.—**Pernot furnace**, an open-hearth regenerative furnace for converting iron into steel, invented in France, but also introduced, with some modifications, to a limited extent in England. It requires for its use both pig and scrap. Its chief peculiarity is that its bed is inclined at a small angle (about 6°) and rotative.

Plumbers' furnace, a portable furnace used by plumbers for soldering, etc.—**Regenerative furnace**, a furnace in which the waste heat of the products of combustion is utilized by being transferred to either the air or the combustible gases, or both, entering the furnace. This transfer is effected by means of so-called "regenerators." See *regenerator*.—**Reheating-furnace**, a reverberatory furnace in which the puddled bars, piled in packets, are reheated preparatory to rolling; a balling-furnace.—**Reverberatory furnace**, a furnace in which the fuel is not brought directly in contact with the material to be acted on by the fire, but which is so arranged that the flame of the burning gases plays over or is "reverberated" upon the ore or metal under treatment. A peculiar kind of reverberatory furnace used in the manufacture of steel is called the *open hearth*. See *hearth*.—**Ring-top furnace**, a charcoal-furnace for heating smoothing-irons. It has an annular top, and cross-bars which can be removed at pleasure. E. H. Knight.—**Spanish furnace**, a form of reverberatory furnace used in Spain, and especially at Linares, one of the most important lead-producing districts in the world. Its chief peculiarity is the presence of two chambers, one of which is the reduction-chamber, while the other has a peculiar and not entirely understood action in checking and modifying the draft.—**Tank-furnace**, in *glass-manuf.*, a furnace fitted with a tank, as distinguished from comparatively small melting-pots, to hold the molten glass.

fuse² (füz), *n.* [*Abbr. of fuse*¹.] A tube, casing, ribbon, etc., of various materials, filled or saturated with a combustible compound, and used as an exploder for firing a blast or for igniting any exploding charge, as of a military shell. A common fuse consists of a rope-like tube filled with some slow-burning composition, as niter, sulphur, and meal powder, its commonest use being to allow the one who ignites it time to get to a place of safety before the explosion. An electric fuse consists of the explosive substance so arranged as to be fired either by a spark of high-potential electricity formed at a break in an electric circuit (the so-called *tension-fuse*), or by the incandescence of a fine (for example, platinum) wire which forms part of the circuit through which the current is passed (the so-called *quantity-fuse*). By extension, devices performing the same function as the common fuse, as mechanical and chemical exploders of all kinds, are termed *fuses*. The fuses used for exploding projectiles are of four kinds: *time*, *percussion*, *concussion*, and *combination*. In the first class the time of burning is regulated by cutting the ribbon, composition-filled tube, etc., to the required length; the second is ignited by the impact of the projectile against an object; the third is operated by the shock of discharge;

while the combination-fuses combine the principles of the other classes with more or less complexity. See *blasting-fuse*. Also spelled *fuz*.—**Abel fuse**, an electric fuse invented by Abel, the explosive material of which is composed of subsulphid and polysulphid of copper with potassium chlorate. It is fired by a spark.—**Percussion-fuse**, a fuse prepared for action by the shock of the discharge, and put in action on striking the object. *Hannakly*.—**Quantity-fuse**, an electric fuse in which the conducting circuit is completed by a short piece of some substance, usually a metal, of tolerably high resistance, which is raised to a high temperature, practically to incandescence, on the passage of a current of sufficient strength.—**Safety-fuse**, a slow-burning ribbon or tape for exploding a blast.—**Tension-fuse**, an electric fuse in which the conducting circuit is not complete, the firing being accomplished by the passage of a spark.—**Wooden fuse**, a hollow plug of wood filled with fuse-composition firmly driven in, the open end being protected from moisture by a water-proof cap, used for exploding military shells. For service, a part of the plug is cut off, according to the length of time it is desired that the composition shall burn, and the plug is then driven into the hole in the shell.

fuse³, *n.* [*Cf. feute*.] The track or trail of a buck in the grass. Also *fusce*.

2. A cone or solid conical piece in a watch or a spring-clock on which is wound a chain or cord, attached at one end to its widest part and at the other to the barrel containing the mainspring, the action of which unwinds it, transferring it to the barrel. The object of the fusee is to equalize the effect of the mainspring, as its force is relaxed through regular diminution of tension, by gradually diminishing the resistance of the chain or cord through its increasing distance from the axis of the fusee. This axis is the arbor of the main wheel, which is attached to the fusee and imparts the motion derived from the spring to the other wheels. In many watches the fusee is now dispensed with, its object being attained by other contrivances. The term is also applied to similar mechanical contrivances used for other purposes. Also called *fusee-wheel*.

1. The seventh letter and fifth consonant in the English alphabet. It is a sign of Italian origin, having been fabricated by the Romans by a slight modification of 'c', when the distinction of the (hard) *g*-sound from the *k*-sound, both until then represented alike by *c*, was found advisable and was effected. (See

C.) *G* has in English two principal or normal sounds, usually called "hard *g*" and "soft *g*" respectively. The former is the value originally belonging to the sign. The "hard" *g*-sound is the sonant (or voiced, or intoned) correlative of the *k*-sound, made by a close contact between the upper surface of the back part of the tongue and the adjacent palate, while breath enough to set the vocal chords vibrating is, during the continuance of the contact, forced up into the pharynx — the breach of this contact, as in the case of the other so-called mutes (or stops, or checks), giving the alphabetic element. The *k*- and *g*-sounds are most often called the guttural mutes; although (since the guttur proper has nothing to do with their formation) many authorities prefer to call them *palatal*, or *back-palatal*. The "soft" *g* sound of *g* in English is compound (= *z*) = *dz*, the sonant correlative of the *ch*-sound (see *ch*); it is, like the soft *c*-sound in relation to hard *c*, a product of the alteration of the hard *g*, the point of contact being shifted forward on the tongue, and a spirant or sibilant vanish being added to the mute element. It belongs mainly to the Romance part of the language. It never occurs at the beginning of words of Anglo-Saxon origin (where *g* is always hard or has changed to *y*); and but rarely at the end of such words (before "silent" *e*, as in *hinge*, *singe*, *swing*). Except in such instances, *g*, in words of Germanic origin, is hard also before *e* and *i*. The principal digraphs containing *g* are *gh* and *gn*. The former is written instead of the earlier guttural spirant *h* (as *night* for earlier *nicht*), and is either silent (as in *night*) or pronounced as *f* (as in *laugh*). With the digraph *ng* is written the nasal which corresponds to *g* and *k* in the same manner as *n* to *d* and *t*, or *m* to *b* and *p*, and which (for example, in *singing*) is just as much a simple sound as *n* or *m*. This guttural or palatal nasal is not an independent alphabetic element in any such way as is *n* or *m*; in the older stages of the languages of our family, it appears only before a next following *g* or *k*, as a nasal made guttural by assimilation to them; and the combination *ng* representing it is simply one in which the *g*, formerly pronounced, has become silent, like the *b* of *mb* in *lamb*, *climb*, *tomb*, etc. *G* is now silent before *n* in the same syllable, as in *gnave*, *sign*. For *g* as the original of consonant *γ*, see *γ*.

On no account perhaps is it [the "Ballad of King Arthur"] more remarkable than the fact of its close imitation of the famous *gabs* made by Charlemagne and his companions at the court of King Hugon, which are first met with in a romance of the twelfth century. . . . It is to be presumed that the author of the ballad borrowed from the printed work, substituting Arthur for Charlemagne, Gawayne for Oliver, Tristram for Roland, etc., and embellishing his story by converting King Hugon's spy into a "lody feend," by whose agency the *gabs* are accomplished.

gabbro (gab'rō), *n.* [A word of obscure origin used in Italy, but more especially in the neighborhood of Florence, and by the marble-workers there, and introduced into lithological science by Von Buch in 1809.] A rock of varied lithological character, essentially, according to the present general acceptance of the name among lithologists, a crystalline-granular aggregate of plagioclase and diallage, with which often occur magnetite (or menachanite) and apatite. Often the diallage is associated with a rhombic pyroxene (bronzeite or hypersthene, two closely allied members of the augite or pyroxene family), and when this predominates the rock passes into what is called *norite*. Olivin is also frequently present, and the predominance of this mineral gives rise to combinations to which the names *olivin-gabbro* and *olivin-norite* have been given. The original *gabbro* of Von Buch, now called *sauzurite-gabbro*, is one of the many alternative forms of *gabbro* proper, which is perhaps the most perplexing of all rocks in respect to the manifold nature of the alterations it is liable to undergo. In regard to the nomenclature of many of these there is not much present unity among lithologists. *Gabbro rosso* (It., red *gabbro*), a rock occurring at the junction of the serpentine and the magnio (a micaceous sandstone) of Tuscany, is an altered sedimentary formation very variable in texture and composition. *Gabbro verde* (It., green *gabbro*), or *gabbro* simply, as it is sometimes called, is serpentine. The *gabbro verde* of Tuscany does not contain diallage; the rock called *gabbro* in Corsica, on the other hand, has crystals of diallage disseminated through the serpentine. *Verde di Corsica* (It., Corsica green), a variety of *gabbro* now called by Italians *grau-tone* and *enfotide* (enphotide), is the beautiful green stone extensively employed in the interior decorations of the Medicean chapel in Florence. It is a crystalline aggregate of *sauzurite* and *smaragdite* (a grass-green variety of hornblende). See *hypersthene*.

In a siege, when making a trench, a row of gabions is placed on the outside nearest the fortress, and filled with earth dug from the trench, forming a breast-work that is proof against musketry fire. By increasing the number of rows to cover the points of junction, complete protection can be attained. Gabions are also largely used to form the foundations of dams and jetties. They are filled with stones, and sunk or anchored in streams where they will become loaded with silt. See *jetty*.

An apartment of much greater length than breadth, serving as a passage of communication between the different rooms of a building, or used for the reception of pictures, statues, armor, etc.; a corridor; a passage.

But loe Polites, one of Priam's sons,
Escaped from the slaughter of Pyrrhus,
Comes fleeing through the weapons of his foes,
Searching all wounded the long *galeries*
And the voyd courtes.
Surrey, Æneid, ii.

For this world and the next world are not to the pure in heart two houses, but two rooms, a *galley* to pass through, and a lodging to rest in, in the same house, which are both under the one roof, Christ Jesus.

Donne, Sermons, x.

Amongst other things he saw *Galeries* full of Greeke Images.
Purchas, Pilgrimage, p. 59.

Hence—2. A room or building for the exhibition of works of art, or, by extension, a collection of such works for exhibition.—3. A platform projecting from the interior walls of a building, supported by piers, pillars, brackets, or consoles, and overlooking the main floor, as in a church, theater, or public library.

After dyner, he departed out of the hall, and went up into a *galarye*, of twenty-four stayres of height.

Berners, tr. of Froissart's Chron., IV. xxxiii.

He sat down amidst the loud clapping of hands, in which the Lords below the bar and the strangers in the *galley* joined.
Macaulay, Historical Essays, IV. 326.

These *galeries* were also useful as adding to the accommodation of the church, as people were able thence to see the ceremonies performed below, and to hear the mass and music as well as from the floor of the church.
J. Ferguson, Hist. [Arch., I. 570.

4. A narrow passage, open at least on one side, and often treated as a decorative feature, on the exterior or interior walls of an edifice, entering into the architectural design and at the same time affording communication between different parts, or facilities for keeping the building in repair.

The name is sometimes given, by extension, to similar features intended only for ornament, and not affording a means of communication. Such galleries are usual in mediæval churches.

Round the roofs [ran] a gilded *galley*
That lent broad verge to distant lands.
Tennyson, Palace of Art.

5. The persons occupying the gallery at a theater.

While all its throats the *galley* extends,
And all the thunder of the pit assents,
Pope, Imit. of Horace, II. i. 326.

The *galeries* would certainly lose much of their veneration for the theatrical kings, queens, and nobles, if they were to see them behind the scenes, unbefriended.
F. Knox, Spirit of Despotism, § 23.

6. An ornamental walk or inclosure in a garden, sometimes formed by trees or shrubs.

These kind of terrasses or little *galeries* of pleasure, Suetonius calleth Meniana.
Corgat, Cruditics, I. 205.

7. An underground passage. Specifically—(a) A horizontal or inclined subterranean passage, whether cut in the soil or built in masonry, connecting different parts of a fortification, or a fortification with a mine or series of mines. In military engineering a *galley* is an underground passage whose dimensions exceed 3 by 4 feet; when of less size, it is called a *branch* or *branch galley*. See *scarp galley* (under *scarp*) and *counterscarp galley* (under *counterscarp*). (b) In mining, a level or drift. [Rarely used except in translating the French word *galérie*.]

In decorated furniture of the eighteenth century the galleries were an important feature. They were commonly of gilt bronze. *Gallery hit*, shot, etc., a showy or superficially brilliant play in a game, such as to win applause from the spectators. [Colloq.—] *Whispering-gallery*, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus, in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the cham-

ber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus.

galley-furnace (gal'ē-ri-fēr'nās), *n.* A peculiar kind of furnace formerly used in the district of Zweibrücken in Germany for reducing mercurial ores. It consisted of a chamber long enough to hold from 30 to 50 cneurbits, arranged in two parallel rows, which were heated by a fire made on a grate below. Each cneurbit had a small separate condenser made of earthenware.

galley (gal'i), *n.*; *pl.* *galleys*, formerly also *gal-lies* (-iz). [Formerly also *gally*, early mod. E. *galry*, *galy*; < ME. *galece*, *galay*, etc., = D. G. It. *galera*, a galley, and E. *gallicass*, *galiot*.] 1. A sea-going vessel propelled by oars, or using both oars and sails.

The earliest ships of all nations were of this class, and were at first confined chiefly to coasting or to the navigation of narrow seas. The war-galley of the Greeks originally had a single mast carrying one square sail amidships, and later two masts, but depended primarily upon its oars, ranged in a single line on each side, and each handled by one rower. It was rated according to the whole number of these. The principal sizes were the *trireme*, of thirty oars, and the *pentecoster*, of fifty. Ships of this form continued to be used as vessels of burden, but were early superseded for war by galleys rated according to the number of banks of oars or ranks of rowers, as the *bireme* (a two-banked vessel), *trireme*, *quadrireme*, etc. Greater numbers of banks are mentioned, up to forty banks of oars in a vessel of enormous size built for Ptolemy Philopator of Egypt. How these numerous banks of oars were arranged is not definitely known; it is probable that not more than three could have been placed one above another. The first recorded Roman fleet consisted wholly of triremes, and this was always the most common armament. The ancient naval vessels were long, sharp, and narrow in model, like a modern steamer, were capable of great speed, and carried large crews. Full decks, or several decks, were in time substituted for the primitive half-deck, or the short decks at the stem and stern; and rams, towers, and other means of offense and defense were added. Gallies continued in use in the Mediterranean and other seas till late in the seventeenth century, ordinary ones in later times having from five to twenty-five oars on a side in a single row, each oar worked by several men, with two or three masts and triangular sails; and indeed they may be considered as not yet entirely obsolete, being represented by the feluccas and boats of similar model on the Mediterranean and neighboring seas. Larger vessels were called *galleass*-es. (See *galleass*.) The labor of rowing was from an early date assigned to mercenaries, and afterward to slaves and prisoners of war; and in some countries, especially France, nearly all criminals were condemned to service on the galleys of the state, and were hence called *galley-slaves*. See *trireme*.

When the Saisnes [Saxons] saugh the *Galleges*, thei were full gladder, and romie in who that myght first in the grettest haste.
Martin (E. E. T. S.), iii. 597.

But in regard to the central question, where the infallibility of the Church lies, the Ultramontanes tell us that the *Gallican* belief, that nothing has the seal of infallibility which has not been received by the whole Church, is extinct in France.
Pusey, Eirenicon, p. 270.

The *Gallican* theory (of church government) views the Church as a constitutional monarchy, of which the Pope is either *Jure Divino*, or merely *Jure Ecclesiastico*, the responsible head; invested with legislative and executive functions while the supreme representative power of the Church, the Ecumenical Council, is in abeyance; but owing implicit obedience to such a Synod when assembled, liable to be suspended or deposed by it, and compelled to submit to its decisions on pain of the guilt and the consequences of schism. *J. M. Neale, Eastern Church, i. 15.*

Gallican Church, the branch of the Roman Catholic Church in France, which has enjoyed greater privileges and had a more independent development than the branches

of that church in other European countries. Its comparative independence has been due to the persistent resistance of the civil power, supported by a portion of the clergy and people distinctively called the Gallican party, to the encroachments of the papal power; but there has always been a strong ultramontane party in the French church favorable to papal claims.—**Gallican liberties**, the peculiar privileges enjoyed by the Gallican Church. In general they consisted of greater freedom from papal domination over the actions of the bishops and of the king than was customary in other Roman Catholic countries, or than is customary in France at the present time. These liberties were especially defined by the pragmatic sanction of Louis IX. in 1269, by the pragmatic sanction of Charles VII. in 1438, and by the "Declaration of the Clergy" drawn up by Bossuet in 1682, which asserted the right of the king to intervene in church matters without papal interference. The Gallican liberties were confirmed under the rule of Napoleon I., but the French church is becoming increasingly ultramontane.—**Gallican liturgies**, **Gallican liturgy**, the liturgies or group of liturgies anciently used in Gaul or France and in some adjacent countries, especially in Spain. In Gaul these liturgies were suppressed by Charlemagne and his successors in the ninth century, and the Roman office was substituted for them. The remains of these rites are few and fragmentary. The wording of some of the prayers in the different local uses differed greatly, but the important features and the arrangement of parts were the same throughout. The liturgies originally used in Spain were of the same class, so that the group has been called the Hispano-Gallican family of liturgies. In Spain these rites had by the eleventh century become almost entirely supplanted by the Roman, but at the beginning of the sixteenth century the typical Spanish form, known as the *Mozarabic liturgy*, was revived by Cardinal Ximenes. The ancient liturgies of the British, Irish, and Scotch apparently belonged to the Gallican group; but their classification is disputed, and the remains are scanty. The use established among the Anglo-Saxons by St. Augustine of Canterbury probably contained Gallican elements, of which there are traces in the use of Sarum, etc. The Gallican type of liturgy is believed to be derived through the primitive churches of Arles and Lyons from Ephesus, and has accordingly been called *Ephesine*, and referred to St. Paul and St. John. It differs greatly from the Roman in its constituent parts, their names, and arrangement, and agrees in many and important particulars with eastern liturgies. The nomenclature of its various parts is, however, almost entirely peculiar to itself, and it is distinguished by the fact that most of these parts, retaining their titles and places in the office, are variable, the number of different occasions for which such variations are provided being also much greater than in other western rites, and this variation extending even to the canon. See *Mozarabic*.

II. n. In Rom. Cath. theol., one who holds Gallican doctrines. See *Gallicanism*.

Gallicanism (gal'i-kan-izm), *n.* [**<** Gallican + **-ism**.] The spirit of nationalism within the French church, as opposed to the absolutism of the papal see. It grew in strength during the middle ages, and culminated in the reign of Louis XIV. The Gallican liberties, in which this spirit was expressed, disappeared at the time of the revolution; and, though since restored and nominally in existence, ultramontanism has during the nineteenth century triumphed over Gallicanism.

Gallicè (gal'i-sè), *adv.* [**<** L. *Gallicè*, in French (Gallic).] [**<** Gallicus, Gallic, French: see *Gallic*.] In French.

Gallicism (gal'i-sizm), *n.* [= F. *gallicisme*; as *Gallic* + **-ism**.] A form or style of speech peculiar to the French language; the use by an English or other foreign writer or speaker of a form or expression, as a particular sense of a word or manner of phraseology, peculiar to the French language. Thus, the use of the word 'assist' in the sense of 'be present' or of the phrase 'it goes without saying,' and similar expressions, are regarded as Gallicisms.

Gallicize (gal'i-siz), *v. t.*; pret. and pp. *Gallicized*, ppr. *Gallicizing*. [**<** *Gallic* + **-ize**.] To make French in opinions, habits, or modes of speech; especially, to render conformable to the French idiom or language. Also spelled *Gallicise*.

gallon (gal'on), *n.* [< ME. *galon*, *galun*, *galoun*, < OF. *galon*, *gallon*, *galoun*, *galun*, *jallon*, *jailon*, F. *gallon* (= Sp. *galon* = Pg. *galão* = It. *gallone*); ML. *galo(n)*, *galona*, a gallon; perhaps ang. of OF. **gale*, *jale*, F. *jale*, a bowl. Cf. *gill⁴*.] 1. An English measure of capacity for dry or liquid substances, but usually for liquids, containing 4 quarts. The old wine-gallon, which was declared by law to contain 231 cubic inches, and to be equal to a cylinder 7 inches in diameter and 6 inches high, is now the legal gallon of the United States, where it is taken as the volume of 8.339 pounds avoirdupois of water at its maximum density weighed in air at 30 inches and 62° F. The imperial gallon now established in Great Britain for all liquid and dry substances contains 10 imperial pounds of distilled water at 62° F., weighed in air of the same temperature and at 30 inches. It has been ascertained to contain 277.274 cubic inches. A statute of 1266 declares that "8 pounds do make a gallon of wine, and 8 gallons of wine do make a bushel." There was thus but one legal gallon. The pound referred to in the statute was somewhat lighter than the troy pound, but it would seem that in course of time the avoirdupois pound was substituted in practice, for the wine-gallon universally used in the latter part of the seventeenth century contained 224.4 cubic inches, while 8 avoirdupois pounds of British wine (of gooseberry or elderberry) measure about 226 inches. This wine-gallon was generally supposed, and in 1689 was legally declared, to contain 231 cubic inches, so that it was found convenient in 1707 to legalize a standard that was more accurately of this capacity. This law remains in force in the United States, though that standard has long been disused. A statute of 1452 defined the gallon as 8 troy pounds of wheat (still recognizing but one gallon), but the standard exchequer gallon constructed under Henry VII., and supposed to represent the gallon then used, contains 274 cubic inches. It was generally thought to contain 272 inches, and the statute of 1697, defining dry measures, was intended to conform to this, although it actually makes the corn-gallon 268.6 cubic inches. Elizabeth constructed a standard gallon of 282 cubic inches (or nearly 8 pounds avoirdupois of wheat), which became the old ale-gallon. The Irish gallon, which from 1450 to 1695 had contained 8 pounds troy of wine, was at the latter date carried to 272 cubic inches; but in 1735 it was again changed to 217.1 cubic inches for all purposes. The Scotch gallon was no less than 840 cubic inches. The United States gallon is equivalent to 3.7853 liters. Abbreviated *gal*.

galvanomagnetic (gal'va-nō-mag-net'ik), *a.* Same as *electromagnetic*.

galvanometer (gal'va-nom'e-tér), *n.* [< *galvanic* + Gr. *μέτρον*, a measure.] An instrument for detecting the existence and determining the strength and direction of an electric current. In all galvanometers the principle of action is the same. It depends upon the force which Oersted discovered to be exerted between a magnetic needle and a wire carrying a current—a force which tends to set the needle at right angles to the direction of the current, and whose intensity, other things remaining the same, depends directly upon the strength of the current.

The term *galvanometer* is applied to an instrument for measuring the strength of electric currents by means of the deflection of a magnetic needle round which the current is caused to flow through a coil of wire.

S. P. Thompson, Elect. and Mag.

Aperiodic galvanometer, a dead-beat or thoroughly damped galvanometer.—**Astatic galvanometer**, an instrument which consists of a pair of similar needles magnetized, with their poles turned opposite ways, and still connected at their centers, so that both will swing together.

Astatic Galvanometer.

The one tends always to turn in a direction opposite to the other under the earth's magnetic attraction, so that if the needles were perfectly alike they would form a perfectly astatic pair, or a pair that would not tend to assume any particular direction from the magnetic influence of the earth. One of the needles, *ab*, is nearly in the center of the coil, CDEF, through which the current passes; the other, *a'b'*, just above the coil. When a current traverses the coil in the direction of the arrows, the action of all parts of the current upon the lower needle tends to urge the astatic pole *a* toward the back of the figure and the boreal pole *b* to the front, while the upper needle, *a'b'*, is affected principally by the current CD of the coil, which urges the astatic pole *a'* to the front of the figure and the boreal pole *b'* to the back. Both needles are thus urged to rotate in the same direction by the cur-

rent, and, as the opposing action of the earth is greatly enfeebled by the combination, a much larger deflection is obtained than would be given by one of the needles if employed alone. Galvanometers are also made astatic by the use of a fixed magnet so placed as to counteract the influence of the earth's magnetism.—**Ballistic galvanometer**, an instrument used to measure the strength of a current which acts for only a very short time, as that produced by the discharge of a condenser. It involves the use of a heavy needle, which takes a relatively long time to swing. The sine of half the angle of the first swing is proportional to the quantity of electricity which has flowed through the coil. **Dead-beat galvanometer**, a galvanometer in which the needle is so damped, by induction or otherwise, that on the passage of a current it will move to its final deflection without oscillation.—**Differential galvanometer**, a form of galvanometer in which the coil consists of two separate wires wound side by side, and used to compare two currents. If the currents are sent in opposite directions through these wires the motion of the needle will be determined by the difference in their intensity; if they were equal the needle would remain stationary.—**Sine galvanometer**, a magnetic needle poised at the center of a coil of insulated copper wire wound round a vertical circle that may be turned horizontally on its stand. In use the needle and vertical circle are at first both in the magnetic meridian. When a current passes, the needle is deflected, and the vertical circle is turned by the observer until its plane coincides with the magnetic axis of the needle. The strength of the current is as the sine of the angular deviation.

Any sensitive galvanometer in which the needle is directed by the earth's magnetism can be used as a *sine galvanometer*, provided the frame on which the coils are wound is capable of being turned round a central axis.

S. P. Thompson, Elect. and Mag., p. 167.

Tangent galvanometer, a very short magnetic needle delicately suspended so as to turn in a horizontal plane. The point about which it turns is at the center of a vertical coil of copper wire through which the current is passed. The diameter of the coil is at least ten or twelve times the length of the needle. The needle is therefore usually not more than half an inch long; and, for convenience of reading its deflections, long light pointers of aluminium or of glass fiber are cemented to its ends. In use the instrument is placed so that the vertical coil of copper wire is in the plane of the magnetic meridian. The current is then sent through the coil, and the angle by which the needle is deflected is read off. The strength of the current then is proportional to the tangent of the angle of deflection, whence the name of the instrument.—**Thomson's mirror galvanometer**, the most sensitive galvanometer yet invented. Its needle, which is very short, is rigidly attached to a small, light, concave mirror, and suspended in the center of a vertical coil of very small diameter by a silk fiber. A movable magnet is provided for bringing the needle into the plane of the coil when the latter does not coincide with the magnetic meridian, and also for rendering the needle more or less astatic. Needle, mirror, and magnet weigh only about 1½ grains. At a distance of two or three feet from the mirror is a solid wooden stand, with a graduated scale, facing the mirror. In the stand, just under the center of the scale, a hole is cut, and a thin wire is stretched upright across it. A strong lamp stands behind the opening, so that its light will fall on the mirror and be reflected back on the scale. An image of the wire will thus be constantly thrown on the scale, and the slightest motion of the needle and its mirror will produce a much greater motion of this image. As the current flows the one way or the other the index will move to one side or the other. This galvanometer was devised for use in connection with the Atlantic submarine cables. It was long the only instrument with which signals could be read through long submarine lines; and it is still employed to a great extent, though now superseded by the siphon-recorder of the same inventor.

Elfvig found that when a root is placed vertically between two electrodes it curves towards the positive electrode—that is, against the direction of the current. In one case (Cabbage) the curvature was towards the negative electrode. Müller (Hettingen), in repeating Elfvig's experiments, found that the curvature was in all cases such as to tend to place the long axis of the root in the plane of the current, the curvature being towards the negative pole. These phenomena are spoken of as "galvanotropism." *Encyc. Brit.*, XIX, 60.

The gambit is said to be *accepted* or *declined*, according as the pawn or piece thus offered is or is not taken. A gambit played by the second player is called a *counter-gambit*. Of all the chess-openings, the *Evans gambit* (so named from a captain of the British navy, who originated it about 1833) has been the most thoroughly analyzed in its multitudinous variations; while next in order probably come the King's Bishop's gambit and the Scotch gambit. Some of the gambits differentiated below in the ordinary chess notation are developments of others, and, in particular, several (the Allgaier, King's Bishop's, Muzio, etc.) are ramifications of the King's gambit proper. — **Allgaier gambit**. 1 P-K4, P-K4; 2 P-KB4, P takes P; 3 Kt-KB3, P-KKt4; 4 P-KR4, P-Kt5; 5 Kt-Kt5. The prizes in the Greek periodical games were generally without intrinsic value, as garlands or wreaths of olive- or laurel-leaves, of parsley, etc.; but at the Panathenaic games of Athens the prizes were quantities of olive-oil from the consecrated orchards, given in a special type of jointed amphora, of which a hundred or more might constitute a single prize. The four great Greek national games formed the strongest bond in the nature of a national union between the various independent Greek states. At them any person of Hellenic blood had the right to contest for the victory, the most highly esteemed honor in Greece; and citizens of all states, however hostile, met at these games in peace.

When he is drunk, asleep, or in his rage; . . .

At gaming, swearing; or about some act

That has no relish of salvation in 't.

Shak., Hamlet, iii. 3.

In the common usage of the two terms "betting" and "gaming," they may sometimes be employed interchangeably, but not always. If two persons play at cards for money, they are said to be gambling or gaming; but they are gambling because they lay a wager or make a bet on the result of the game, and therefore to say they are betting is equally appropriate. If two persons lay a wager upon the result of a pending election, it will be said that they are betting, but not that they are gaming. There is no *gaming* in which the element of the wager is wanting, but there is betting which the term *gaming* is not commonly made to embrace. *Justice T. M. Cooley.*

ganglion (gang'gli-on), *n.*; pl. *ganglions, ganglia* (-onz, -i). [*Gr. γάγγλιον*, a tumor, < *Gr. γάγγω*, a tumor under the skin, on or near a tendon.] 1. An enlargement in the course of a nerve, containing or consisting of a collection of ganglion-cells; any assembly of ganglion-cells. The nervous system of invertebrates generally, and the sympathetic nervous system of vertebrates, consists essentially of a chain or series of ganglia connected by commissures, giving off filaments in various directions, forming plexuses or networks around principal viscera, blood-vessels, and other important organs. Some of the larger sympathetic ganglia are also called *plexuses*; thus, the semilunar ganglia of the abdomen form the solar plexus. In the cerebrospinal nervous system of vertebrates, ganglia regularly occur on the posterior or sensory roots of the spinal nerves. There are likewise ganglia upon some of the motor or sensorimotor cranial nerves, as the vagus, fifth, and facial. All the masses of gray neurine in the brain are also ganglia, as the optic thalami, corpora quadrigemina, corpora striata, etc.; even the general mass of cortical gray matter, both of the cerebrum and of the cerebellum, constitutes a great ganglion. The principal ganglia have special names. See the phrases below.

In addition to the function which belongs to nerve-fibers of receiving and transmitting nervous impulses, ganglion-cells may have the function of distributing, increasing, diminishing, and in some cases apparently of initiating such impulses, as well as of being a tropical center for nerve-fibers connected with them. Such cells are abundant in the gray matter of the brain and spinal cord, in the ganglia of the dorsal roots of spinal nerves, and in the ganglia of the sympathetic system, and they may exist as scattered cells or form plexuses, as those of Auerbach and Meissner. Besides these unipolar, bipolar, and multipolar cells, cells without processes have been described as ganglion-cells, and called *apolar*. They are regarded by some as having lost their processes in the course of anatomical and microscopic manipulation, and by others as being embryonic forms. Ganglion-cells, with the nerve-fibers and certain terminal structures, make up the essential parts of the nervous system. See *cut under retina*.

The solan-geese, *Sula bassana*, a large totipalmate swimming bird of the family *Sulidae* and order *Steganopodes*. It is about 3 feet long and 6 feet in stretch of wings, and of a white color tinged with amber-yellow on the head, with black primaries.

Gannet (*Sula bassana*), adult and young.

It inhabits the Atlantic coasts of Europe and North America, feeds on fish, which it catches by pouncing down upon them from on high, and congregates in vast numbers to breed in certain rocky places on the seacoast. It is a strong flier, but is not found far from land. Some of the principal breeding-places are the Hebrides, St. Kilda, Ailsa Craig, and the Bass Rock, on the European coast, and the "Gannet Rock," in the gulf of St. Lawrence. The flesh is rank, but the young are sometimes eaten, and the old birds are taken in numbers for their feathers.

2. *pl.* The birds of the family *Sulidae*; the boobies, of which there are several species, of the genera *Sula* and *Dysporus*.

Ganocephala (gan-ō-sef'ā-lā), *n. pl.* [NL., neut. *pl. of ganocephalus*: see *ganocephalus*.] An order of extinct labyrinthodont amphibians. The endoskeleton is notochordal and osseous; the bodies of the vertebrae are each represented by a basal intercentrum and a pair of pleurocentra; there is no occipital condyle; the vomer is divided; the temporal fossae are overarched by bone; and the head is covered with polished horny or ganoid plates, whence the name. The genera *Archegosaurus* and *Dendropteron* are added by Owen as examples of this order.

Owen has distinguished the oldest forms [of labyrinthodonts] with armoured skull as *Ganocephala*.
Claus, Zoology (trans.), II. 188.

ganocephalous (gan-ō-sef'ā-lus), *a.* [NL. *ganocephalus*, < Gr. *γάνος*, brightness, sheen, luster, + *κεφαλή*, the head.] Having the head covered with shining polished plates; specifically, having the characters of the *Ganocephala*.

See *ent* under *scale*. — 2. Having ganoid scales or plates, as a fish; specifically, of or pertaining to the *Ganoidei*: as, a *ganoid* fauna.

II. *n.* One of the *Ganoidei*; a fish of the order *Ganoidei*.

Also *ganoidcan*, *ganoidian*.

The *ganoids* are an ancient group, well developed in the palaeozoic rocks, but now dying out. The fossil genera are numerous and the species highly differentiated, but to-day only eight genera and between thirty and forty species comprise the ganoid fauna of the world.

Stand. Nat. Hist., III. 91.

ganoidal (ga-noi'dal), *a.* [< *ganoid* + -*al*.] Same as *ganoid*.

Ganoidea (ga-noi'dē-ā), *n. pl.* [NL.] Same as *Ganoidei*, 2.

ganoidcan (ga-noi'dē-an), *a. and n.* Same as *ganoid*.

Ganoidei (ga-noi'dē-i), *n. pl.* [NL., *pl. of ganoideus*: see *ganoid*.] 1. In Agassiz's system of classification, one of four orders into which the class of fishes was divided. It contained those which have ganoid scales or plates of an angular, rhomboidal, polygonal, or subcircular form, as distinguished from those with placoid, cycloid, or ctenoid scales. As thus framed by Agassiz, the ganoids were an artificial group, including silurids, plectognaths, lophobranchs, and other teleost fishes. By Owen the *Ganoidei* were divided into two suborders, *Lepidoganoidei* and *Placoganoidei*. By later authors the group has been restricted and raised to the rank of a subclass.

Hence — 2. In Müller's system, a subclass of fishes with muscular or multivalvular aortic bulb, free branchia, covered gill-cavity, and no optic chiasm, a spiral intestinal valve (sometimes rudimentary), and usually fulera on one or more fins. It was divided by Müller into two orders: *Chondrostei*, with a cartilaginous skeleton, as the sturgeons and paddle-fishes, and *Holostei*, with bony skeleton, as the *Polypteridae*, *Lepidosteidae*, *Anabidae*, and many extinct forms. Each one of the existing families of ganoids has been made the type of an order by late writers. Thus, the sturgeons (*Acipenseridae*) typify the order *Chondrostei* in a restricted sense, or *Glaniostrani*; the paddle-fishes (*Polyodontidae* or *Spatulariidae*), the order *Selachostomi*; the Ichthyosaurs (*Polypteridae*), the order *Crossopterygia* or *Actinistia*; the bony pikes or gars (*Lepidosteidae*), the order *Rhomboganoidei* or *Ginglymodi*; and the bowfins (*Anabidae*), the order *Cycloganoidei* or *Halecomorphi*. Besides these there are three extinct orders, *Acanthodini*, *Placodermi*, and *Pycnodontini*. The ganoids abounded in former geologic periods, as far back as the Silurian; but the few above named are the only extant types. See *ganoid*, *n.* Also *Ganoidea*.

ganoin (gan'ō-in), *n.* [< Gr. *γάνος*, brightness, sheen, luster (see *ganoid*), + -*in*.] The peculiar bony tissue which gives the enamel-like luster and transparency to the plates of ganoid fishes and of some labyrinthodonts. It is simply dense homogeneous bone.

A military punishment formerly inflicted for heinous offenses, in which the offender, stripped to his waist, was compelled to run a certain number of times through a lane formed by two rows of men standing face to face, each of them armed with a switch or other weapon with which he struck the offender as he passed; also, such a punishment used on board of ships, and, by extension, any similar punishment (used by some savage tribes and in Russia). Among the North American Indians this was a favorite mode of torturing prisoners of war, who often died under it. The Indians struck their victims with clubs, knives, lances, or any other convenient weapon.

At ebb-tide it shows its presence by a hole in the sand left when it withdraws its siphon, and it is found by digging to the depth of a foot or more. These clams are extensively used for the table and for bait. Along the eastern coast of the United States the *gaper* is commonly known as the *soft clam*, or in more northern ranges simply as the *clam*. (See cut under *Myida*.) Formerly the knights companions were elected by the body itself, but since the reign of George III. appointments have been made by the sovereign. The order, at first (and still sometimes) called the Order of St. George, was instituted

Order of the Garter.—Star, Collar, and George.

tuted by Edward III. some time between 1344 and 1350, the uncertainty arising from the early loss of all its original records. Its purpose has been supposed to have been at first only temporary. According to the common legend, probably fictitious, King Edward III. picked up a garter dropped by the Countess of Salisbury at a ball, and placed it on his own knee, with the words to his courtiers, in response to the notice taken of the incident, *Honi soit qui mal y pense* (shamed be he who thinks evil of it). To this incident the foundation, the name, and the motto of the order are usually ascribed. The insignia of the order are the garter, a blue ribbon of velvet edged with gold and having a gold buckle, worn on the left leg; the badge, called the George or great George, a figure of St. George killing the dragon, pendant from the collar of gold, which has twenty-six pieces, each representing a coiled garter; the lesser George, worn on a broad blue ribbon over the left shoulder; and the star of eight points, of silver, having in the middle the cross of St. George encircled by the garter. The vestiture consists of a mantle of blue velvet lined with white taffeta, a hood and surcoat of crimson velvet, and a hat of black velvet with a plume of white ostrich-feathers, having in the center a tuft of black heron-feathers. When the sovereign is a woman, she wears the ribbon on the left arm.—**Prick the garter**. See *fast* and *loose*, under *fast* 1.

gas (gas), *n.* [A word invented by the Belgian chemist Van Helmont (died 1644), who expressly says "Hunc spiritum, incognitum haecenus, novo nomine *gas* voco" (this vapor, hitherto unknown, I call by a new name, *gas*). The word came into general use: D. G. Dan. Sw. *gas*, *F. Pg. gaz*, *Sp. It. gas*, *Russ. gas*, *Hind. gas*, etc. Various guesses have been made at the word which might possibly have suggested the particular syllable *gas*, as *D. geest* (*AS. gäst*, *E. ghost*), spirit; *G. gäsch*, froth, foam; *Sw. gäsa*, ferment, efferversee; *F. gaze*, gauze, etc.] 1. A substance possessing perfect molecular mobility and the property of indefinite expansion. The term was originally synonymous with *air*, but was afterward applied to substances supposed (but wrongly—see below) to be incapable of reduction to a liquid or solid state. In accordance with this use a gas was defined to be a permanently elastic fluid or air differing from common air. According to the kinetic theory of gases, now accepted, the molecules of a gas are in a state of rapid motion in right lines, constantly colliding with one another and with the walls of any containing vessel, and hence exerting pressure against them. For example, in the case of air at ordinary temperatures it is calculated that the average velocity of the molecules is about that of a rifle-bullet as it leaves the gun. If a gas is compressed into less volume, the number of impacts against the sides of the containing vessel is in-

creased, and hence the pressure or tension increases, and conversely (Boyle's law). The temperature, according to this theory, is the average kinetic energy of a molecule; hence, increased temperature brings increased momentum, and so increased pressure on the walls of the vessel. This theory also explains many of the phenomena of viscosity, diffusion, etc. By increased pressure and diminished temperature (at least below the critical point) any gas can be reduced to the liquid form, the amount of pressure and degree of cold required differing widely with different gases. The so-called *fixed* or *permanent* gases, which were long supposed to be incompressible, as hydrogen, oxygen, nitrogen, etc., yield only to extreme conditions of cold and pressure. There is no essential difference between a *gas* and a *vapor* (see *vapor*), but for convenience the latter name is given to the gaseous form of substances which under the ordinary conditions of temperature and pressure are liquids or solids. Vapors and the gases most easily liquefied deviate most widely from Boyle's law, that the volume is inversely proportional to the pressure, and also from the law of the constant increment of expansion with increase of temperature. *Gases* are distinguished from *liquids* by the name of *elastic fluids*, because of their power of indefinite expansion. (See *liquid*.) The number of gaseous bodies is great, and they differ greatly in their chemical properties. They are all, however, susceptible of combining chemically with fluid and solid substances. Some of them are of great importance in the arts and manufactures, as, for example, carbonic acid or carbon dioxide, sulphurous acid or sulphur dioxide, and coal-gas. Gases are ordinarily invisible.

That such subterranean steams will easily mingle with liquids, and imbue them with their own qualities, may be inferred from the experiment of mixing the *gas* (as the Helmontians call it), or the scarce coagulable fumes of kindled and extinguished brimstone, with wine, which is thereby long preserved.

Boyle, *Origin and Virtues of Gems*, ii.

Gases are distinguished from other forms of matter, not only by their power of indefinite expansion so as to fill any vessel, however large, and by the great effect which heat has in dilating them, but by the uniformity and simplicity of the laws which regulate their changes.

Clerk Maxwell, *Heat*, p. 31.

Specifically—2. In *coal-mining*, any explosive mixture of fire-damp with common air.—3. In popular language, a compound of various gases, used for illuminating and heating purposes. It is some form of carbureted hydrogen artificially made and distributed by pipes to points of consumption. The common kind is *coal-gas*, obtained from bituminous coals by carbonization in retorts at a high temperature. A carbureted hydrogen gas, called *water-gas*, resulting from the passing of steam through a mass of incandescent carbon and the subsequent admixture of hydrocarbons or other enriching substances, is also used. *Oil-gas* is an illuminating gas obtained by the distilling at high temperature of petroleum or other liquid hydrocarbons.

4. A *gas-light*: as, the *gas* is dim; turn down the *gas*. [Colloq.]—5. Empty or idle talk; frothy speech; rant. [Colloq.]

—**Natural gas**, combustible gas formed naturally in the earth. It is sometimes found issuing through crevices, but is generally obtained by boring. Natural gas has long been used in western China and elsewhere. It has been found in great abundance in western Pennsylvania and the adjoining region of New York, as also to a limited extent in Ohio, Indiana, and West Virginia. It was first utilized in New York in 1821, and began about 1874 to be of importance commercially, especially in the vicinity of Pittsburgh. The area over which natural gas and petroleum are obtained in quantity, and the conditions of their occurrence, are in most respects essentially the same, but the principal source of the gas in Ohio and Indiana is a formation lower down in the geological series than that furnishing it in Pennsylvania. In the former States the gas comes from the Trenton limestone, a group belonging to the Lower Silurian; in the latter, from the Devonian. The natural gas burned at Pittsburgh contains about 67 per cent. of marsh-gas, 22 of hydrogen, 5 of an ethylene compound, 3 of nitrogen, together with a small percentage of carbonic acid, carbonic oxid, olefiant gas, and oxygen.—**Rock-gas.** Same as *natural gas*.

The resulting flames assume the fancied forms of beaks, bats' wings, fish-tails, cockspurs, etc., whence the different forms of burners have received distinctive names. The material used to tip or form the tops of the burners has also given names to them, as the lava-tip burner. See *burner*.—**Argand gas-burner**, a gas-burner made to produce a flame on the principle of that of the Argand lamp (which see, under *lamp*).—**Intensive gas-burner**, a multiple gas-burner formed by a number of bat's-wing burners arranged circularly about the supply-pipe. The Broadwell gas-check consists of a curved steel or copper ring and a circular bearing-plate slightly

gas-meter (gas'mō'tēr), *n.* An apparatus through which illuminating gas is made to pass, in order to ascertain the number of cubic feet of it produced at gas-works or consumed by those supplied with it. Of this apparatus there are two types, the wet and the dry, the former being now principally used for measuring the quantity produced, and the latter, on a much smaller scale, the quantity consumed. The wet meter is composed of an outer box about three fifths filled with water. Within this is a revolving four-chambered drum, each chamber being capable of containing a definite quantity of gas, which is admitted through a pipe in the center of the meter, and, owing to the arrangement of the partitions of the chambers, causes the drum to maintain a constant revolution. This sets in motion a train of wheels carrying the hands over the dials which mark the quantity of gas passing. The dry meter consists of two or three chambers, each divided by a flexible partition or diaphragm, by the motion of which the capacity on one side is diminished, while that on the other is increased. By means of slide-valves, like those of a steam-engine, worked by the movement of the diaphragms, the gas to be measured passes alternately in and out of each space. The contractions and expansions act in motion the clockwork which marks the rate of consumption. The diaphragms in all the chambers are so connected that they move in concert.

upper end, and resting at the open lower end in a masonry or brickwork water-tank of corresponding form, in which it rises or falls according to the amount of gas passing into or out of it. The holder (often more than 100 feet in diameter, and sometimes made in telescoping sections) is suspended from a heavy framework by chains passing over pulleys and terminating in partially counterbalancing weights, which aid in regulating the pressure. The name *gas-holder* is often used for the whole structure, as more appropriate than *gasometer*, since it is not in any sense a meter.

(a) Originally it was considered by some as a section and by others as an order of the mollusks, which were then ranked as a class. Later it was raised to a class and almost universally accepted as such. (1) It has generally been customary to include in it all the mollusks with a distinct head and foot developed from the abdominal surface, thus contrasted with the classes *Cephalopoda* and *Pteropoda*. (2) By many it has been extended to include all having a head, thus embracing the *Pteropoda* and excluding only the *Cephalopoda*. (3) By others it has been restricted to those having a distinct head, abdominal foot, and a spiral, subspiral, or low oval or conic shell or naked body, thus excluding the *Scaphopoda*. (4) By others still it has been further confined to those having a spiral or subspiral shell or naked body, and a more or less asymmetrical arrangement of the internal organs, the *Chitonidea* and some naked related types being consequently eliminated. Within even the narrowest limits assigned to it, the class is very diversified. Generally a univalve shell is developed, but in many forms of several orders or suborders the shell is obsolete or entirely absent in the adult. Even in the naked forms, however, the embryo or larva is generally provided with a shell. The shell is usually spiral, or rather of an elongated conic form wound round in a spiral coil, but varying from a very high turreted form to a discoid or even sunken spire, an intermediate stage being the most common; in various types it is of a broad conic or patelliform shape, and in others, especially the terrestrial slugs, it is reduced to a scale-like element concealed under the mantle. The shape of the shell generally agrees with the structure of the soft parts, but sometimes differs so much that a gastropod can only be properly classified by examination of the anatomy of the animal. In most marine species, as well as in many terrestrial ones, an operculum more or less closing the aperture of the shell is developed from the foot of the animal; but in most of the land-shells (*Pulmonifera*) it is wanting. One of the distinguishing characteristics of *Gasteropoda*, giving name to the class, is the foot, which is generally broad, muscular, and disk-like, and attached to the ventral surface; but in some it is obsolete, and in others, as the *Heteropoda*, compressed and adapted for swimming. The garden-snail may be regarded as a typical gastropod. The class comprises also whelks, periwinkles, limpets, cowries, and many other univalve or shell-less forms. No known gastropod has a bivalve shell. *Cochlidia* is a synonym.

See *gastrula*. It is a supposed primeval intestinal animal of the form-value of a gastrula (palingenetic archigastrula) or germ-cup, consisting of two germ-layers or blastodermic membranes, ectoderm and endoderm, the latter inclosing a visceral cavity or archenteron, and being itself inclosed in the ectoderm, and having a protostoma or primitive blastopore communication with the exterior. Snakes seldom have on the belly many small scales like those of the back and sides, being usually furnished instead with short, wide, transverse gastrosteges which reach from side to side, and are imbricated, the hind edge of one overlapping the fore edge of the next succeeding. By muscular action when the snake is wriggling the whole series of gastrosteges stand somewhat on edge, so that their sharp hind borders catch on the slightest inequality of the surface, over which the snake thus glides as if pushed along by numberless little feet. That such is the action of the gastrosteges may be inferred from the ineffectual writhing of a snake when placed on a perfectly smooth surface, as a plate of glass. The last gastrostegē, technically called the *preanal* or *postabdominal*, is usually bifid, or otherwise modified. Scutes somewhat like gastrosteges cover the under side of the tail, and are known as *urosteges*. See *urostegē*.

B, longitudinal section through the axis: g, primitive intestine (primitive intestinal cavity); b, blastopore or primitive mouth (primitive mouth-opening); i, inner cell-layer of the body-wall; the inner germ-layer, hypoblast, endoderm, or intestinal layer; e, outer cell-layer (the outer germ-layer, epiblast, ectoderm, or skin-layer). (From Haeckel's "Evolution of Man.")

It is the result of that process of invagination which occurs in most animals, whereby a vesicular morula, blastosphere, or blastula is converted into a cup-like two-layered germ, with a blastopore or orifice of invagination, and an endoderm or membrane inclosing a primitive intestinal cavity, the endoderm itself being inclosed within an ectoderm. The word enters into many loose compounds of obvious meaning, as *gastrula-body*, *-cup*, *-form*, *-formation*, *-germ*, *-mouth*, *-stage*, *-stomach*, etc., mostly derived from the translation of the German compounds used in Haeckel's works. See *gastrulation*.

The stage of embryonic development in which the cellular wall consists of two layers of cells is called by Haeckel the "*gastrula stage*." L. F. Ward, Dynam. Sociol., I. 339.

(No nutritive yolk in these eggs; none advanced enough to show any mesoblastic cells or mesoderm.) In all, same letters mark same parts: *c*, the egg, ovum, cytula, or parent-cell; *f*, cleavage-cells, blastomeres, or segmentella; *m*, mulberry-germ or morula; *b*, vesicular germ or blastula; *g*, germ-cup or gastrula; *s*, cleavage-cavity, blastocoele, or hollow; *bl*, blastulation; *d*, primitive intestinal cavity, archenteron, or groove of gastrulation; *a*, primitive mouth, archostoma, or blastopore. Figs. 12-17. Total but unequal egg-cleavage of a mammal (woman), resulting in another modified amphigastrula or hood gastrula. 12, cytula; 13, cleavage stage of 2 cells; 14, same, of 4 cells; 15, morula beginning to undergo gastrulation without actual blastulation; 16, gastrulation further advanced (theoretically corresponding to the blastulae of figs. 4, 5, and 10); 17, gastrulation completed (and to be followed, not preceded as in the other cases, by blastulation, or the formation of a blastodermic vesicle). (From Haeckel's "Evolution of Man.")

a kind of gastrulation ensues directly upon morulation, and therefore precedes blastulation.

century a slit was made at the palm, through which the hand could be passed, allowing the mail mitten to hang from the wrist. A few instances of mail gauntlets with separated fingers appear in English monuments of the same period. The changes after this are merely in the direction of greater delicacy of execution, allowing still freer movement. In tournaments and jousts the left hand was sometimes guarded by a heavy steel glove without joints. See *main-de-fer*. Also called *glove-of-mail*.

In *old Eng. law*, rent; tribute; toll; custom; more specifically, rent payable otherwise than in feudal military service. — 2. The tenure by which, according to either the ancient Saxon or Welsh custom, land on the death of the tenant did not go to the eldest son, but was partitioned in equal shares among all the sons, or among several members of the family in equal degree, or by which, according to the Irish custom, the death of a holder involved a general redistribution of the tribal lands. Compare *gavelkind*.

gavelkind (gav'el-kind), *n.* [*< Ir. gabhail-cine, gavelkind, < gabhail, a taking (a tenure), = Gael. gabhail, a taking, a lease, farm, = W. gafaet = Corn. gavel, a hold, holding, tenure (see gavel), + Ir. cine, a race, tribe, family (cf. W. cenedl, a tribe).*] 1. Originally, in *old Eng. law*, the tenure of land let out for rent, including in that term money, labor, and provisions, but not military service; also, the land so held. The most important incident of this tenure was that upon the death of the tenant all his sons inherited equal shares; if he left no sons, the daughters; if neither, then all his brothers inherited equal shares. When the feudal system introduced the law of primogeniture, the county of Kent and some other localities were privileged to retain this ancient custom of inheritance.

Miss Rossetti comes commended to our interest, not only as one of a family which seems to hold genius by the tenure of *gavelkind*, but as having a special claim by inheritance to a love and understanding of Dante.

Lowell, Among my Books, 2d ser., p. 47.

Hence — 2. In general use, land in Great Britain or Ireland, or an estate therein, which by custom having the force of law is inheritable by all the sons together, and therefore subject to partition, instead of going exclusively to the eldest. The landholders held their estates by . . . an extraordinary tenure, that of *Irish gavelkind*. On the decease of a proprietor, instead of an equal partition among his children, as in the *gavelkind* of English law, the chief of the sept . . . made, or was entitled to make, a fresh division of all the lands within his district.

[Scotch.]

gear-cutter (gēr'kut'ēr), *n.* One who or that which makes toothed or geared wheels for transmitting motion in machinery; specifically, a machine for cutting the teeth of a geared wheel. Gear-cutters are frequently grinding-machines, an emery-wheel being used to cut away the superfluous

material between the cogs or teeth, the shape of the emery-wheel determining the shape of the inter-dental space, and consequently determining the shape of the teeth. Milling-cutters are also much used. Gear-cutting machines usually have the shape of a lathe, the blank being supported on the mandrel, and the cutting-wheel by the tool-rest. The number and pitch of the teeth are regulated by a graduated disk attached to the mandrel, and the cutter is driven by various systems of gearing. Large machines have been made to work as planers, and arranged for every variety of angle and level gearing. Wood-working gear-cutters are rotary cutters (molders), and are used to cut wooden patterns for casting geared wheels. Gear-cutters are also made to cut wheels of epicycloidal form. A gear-cutting attachment is also used with some milling machines. See *odontograph*.

gearing (gēr'ing), *n.* [Verbal *n.* of *gear, v.*]

1. Gear; dress; harness.—2. In *mach.*, the parts collectively by which motion communicated to one part of a machine is transmitted to another; specifically, a train of toothed wheels for transmitting motion. There are two chief sorts of toothed gearing, namely, *spur-gearing* and *bevelled gearing*. In the former the teeth are arranged round either the concave or the convex surface of a cylindrical wheel in the direction of radii from the center of the wheel, and are of equal depth throughout. In bevelled gearing the teeth are placed upon the exterior periphery of a conical wheel in a direction converging to the apex of the cone, and the depth of the tooth gradually diminishes from the base. See *bevel*, and *cut under bevel-gear*.

—**Angular gearing**. See *angular*.—**Bevelled gearing**. gelatigenous (jel-a-tij'e-nus), *a.* [< *gelati*(n) + Gr. -γενής, producing; see -genous.] Producing or yielding gelatin. — **Gelatigenous tissue**, animal tissue which yields gelatin in boiling water, as the various forms of connective tissue.

gelatin, **gelatine** (jel'a-tin), *n. and a.* [= D. *G. gelatine* = Dan. Sw. *gelatin*, < F. *gelatine* = Sp. Pg. It. *gelatina*, < NL. *gelatina*, < L. *gelatus*, pp. of *gelare*, freeze; see *geat*, *gelid*, *jelly*.] I. *n.* A concrete animal substance, transparent, hard, and tasteless, which swells without solution in cold water, dissolves in warm water and in acetic acid, and is insoluble in alcohol or ether. Gelatin does not exist as such in the animal tissues, but is formed by the action of boiling water on connective tissues, cartilage, ligaments, and tendons, as well as on skin, horn, fish-scales, etc. The coarser form of gelatin from hoots, hides, etc., is called *glue*; that from skin and finer membranes is called *size*; and the purest gelatin, from the air-bladders and other membranes of fish, is called *isinhuss*. Its leading character is the formation of a tremulous jelly when its solution in boiling water cools. A yellowish-white precipitate is thrown down from a solution of gelatin by tannin, which forms an elastic adhesive mass. Tannin has the same action also on the tissues from which gelatin is made, and this action of tannin is the foundation of the art of tanning leather. Gelatin is nearly related to the proteids. It is regarded as a nutritious food, and much used in preparing soups, jellies, etc.; but animals fed exclusively on it die with the symptoms of starvation. No chemical formula has yet been deduced for gelatin. It contains about 18.3 per cent. of nitrogen, 0.6 per cent. of sulphur, 50 of carbon, 7 of hydrogen, and 23 of oxygen. (See *jelly*.) In all the arts allied to photography, gelatin forms the basis of a great variety of processes. It is at present the usual vehicle for holding the sensitive salts of silver in dry plates, and for holding the sensitive bichromate of potash in all the photo-printing and photo-engraving processes. (See *emulsion*, *carbon process* (under *carbon*), *photolithography*, *heliochrome*, and *photography*.) Gelatin is also used to form the copying-pad in a variety of copying processes. See *heliography*. — **Chromatized gelatin**. See *chromatize*. — **Explosive gelatin**, a very powerful explosive compound made by dissolving gun cotton in nitroglycerin heated gently in a water-bath. A small amount of gum camphor may be added to diminish its sensitiveness. For military purposes it has been made of 90 per cent. of nitroglycerin and 10 per cent. of soluble nitrocellulose or gun cotton. To make the camphorated compound, 90 per cent. of the above mixture and 4 per cent. of camphor is used. This preparation forms a gelatinous, elastic, translucent, pale-yellow mass (specific gravity 1.6), of about the consistency of a very stiff jelly, which can be easily cut with a knife. (C. E. Munroe.) Also called *gun-dynamite*. — **Gelatin culture**. See *culture*. — **Gelatin of Wharton**, or *Jelly of Wharton*, a kind of mucoid connective tissue which constitutes most of the bulk of the umbilical cord. — **Gelatin process**, any photographic process in which gelatin enters as a basis or an element. — **Gelatin sugar**. 1. In *bot.*, the act of budding; also, the manner in which a young leaf is folded up in the bud before its unfolding.—2. In *zool.*, the process of reproduction by buds; the formation of a new individual by the protrusion and complete or partial separation of a part of the parent; budding. Gemmation, when complete, is a kind of fission, but the part budded is commonly small in comparison with the size of the parent.

Gemmation consists in the production of a bud or buds, usually from the outside, but sometimes from the inside, of an animal; which buds become developed into more or less completely independent beings. The fresh beings thus produced by budding are all known as zooids. . . . When the zooids produced by budding remain permanently attached to one another and to the parent organism which produced them, the case is said to be one of "continuous" gemmation, and the ultimate result of this is to produce a colony or composite structure, composed of a number of similar and partially independent beings, all produced by budding, but all remaining in organic connection.

H. A. Nicholson, *Advanced Text-Book of Zoology*, iv.

Among creatures of higher grades, by fission or gemmation, parents bequeath parts of their bodies, more or less organized, to form offspring at the cost of their own individualities.

3. In *gram.*, a formal distinction in words, apparently founded on and in part expressing differences of sexual character, as male and female, or as male, female, or of neither sex (*neuter*). In the languages of the Indo-European family the distinction originally is threefold, as masculine, feminine, and neuter (the first including principally male beings, the second female, and the third those of no sex), and appears in nouns, adjectives, and pronouns (except the personal pronouns), although among masculines and feminines are included (on grounds not yet made clear) many words designating things of no sex. In the Semitic languages the genders are only two, masculine and feminine, and the distinction is made also in the second and third persons of verbs. In the majority of languages distinction of gender is altogether wanting. In some tongues differences not of sex are made the ground of formal distinction

also called by some by the name *gender*: thus, that of animate and inanimate objects in American languages; a manifold distinction (of obscure origin) in South African languages, and so on. Some languages, like the modern French, have lost the neuter gender, and have masculine and feminine only; some, like English, have no gender except in a few pronouns, as *he, she, it*; some, like modern Persian, have no gender whatever.

than a regiment: as an official title, used either
alone for the highest or next to the highest rank,
or with an adjunct designating the particular
grade. See *lieutenant-general*, *major-general*, and
brigadier-general. In modern European armies the
specific rank of general is usually the highest under that
of marshal or field-marshal. In the United States the title,
when used, is that of the acting commander-in-chief of the
whole army (the President being the titular commander-
in-chief). The rank has been held, under temporary laws,
only by Generals Washington, Grant, and Sherman, and
for a short time before his death in 1888 by General Sheri-
dan, whose previous title as commander-in-chief was lieu-
tenant-general. In address and common speech any gen-

but has the right to sit and vote with the bishops in a gen-

Although, for example, we had never seen but one rose, we might still have been able to attend to its colour, without thinking of its other properties. This has led some philosophers to suppose that another faculty besides abstraction, to which they have given the name of *generalization*, is necessary to account for the formation of genera and species. *D. Stewart, Elements, iv. § 1.*

2. Induction; an inference from the possession of a character by each individual or by some of the individuals of a class to its possession by all the individuals of that class; the observation that the known individuals of a species, or the known species of a genus, have a character in common, and the consequent attribution of that character to the whole class; also, a conclusion so reached.

In our inquiries into the nature of the inductive process, we must not confine our notice to such *generalizations* from experience as profess to be universally true. *J. S. Mill, Logic, III. xxiii. § 1.*

When we have proved with respect to the circle that a straight line cannot meet it in more than two points, and when the same thing has been successively proved of the ellipse, the parabola, and the hyperbola, it may be laid down as a universal property of the sections of the cone. . . . It would be difficult to refuse to the proposition arrived at, the name of a *generalization*. . . . But there is not induction. *J. S. Mill, Logic, III. ii. § 2.*

I am not going to attempt a definition of the Anglo-Saxon element in English literature, for *generalizations* are apt to be as dangerous as they are tempting. *Lowell, Study Windows, p. 246.*

3. In *math.*, the process or result of modifying a proposition so as to obtain another having wider subject and predicate, but such that a limitation which, if applied to the new subject, gives the old subject, will reproduce the old predicate when applied to the new. For example, Fermat's theorem is that if p is any positive prime number and a any number not divisible by p , then the division of a^{p-1} by p leaves 1 as the remainder. A generalization of this is, that if k is any positive integer, and $\phi(k)$ the number of numbers as small as k and prime to it, and a is any number relatively prime to k , then the division of $a^{\phi(k)}$ by k leaves 1 as the remainder; for when k is a prime number, $\phi(k) = k - 1$, and every number not divisible by k is prime to it. The language of mathematics differs from that of logic in that from every generalization of a proposition the proposition itself is immediately deducible, which is not true in the logicians' sense of the word. The distinction between *generalization* and *extension* in mathematical language is not very clear, but the latter term applies primarily to a conception or function which has received a new and wider definition; also, the modification of a proposition concerning two dimensions so as to make it apply to three is called an *extension*.

Also spelled *generalisation*.

II. *intrans.* 1. To recognize that two or more objects have a common character; to form a general notion. [Brought into use by Reid.]

We are next to consider the operations of the understanding, by which we are enabled to form general conceptions. These appear to me to have three:—First, The resolving or analyzing a subject into its known attributes, and giving a name to each attribute, which name shall signify that attribute, and nothing more. Secondly, The observing one or more such attributes to be common to many subjects. The first is by philosophers called abstraction; the second may be called *generalizing*; but both are commonly included under the name of abstraction. *Reid, Intellectual Powers (1785), p. 445.*

2. To reason inductively, from particular cases to general rules comprehending those cases.

The reviewer holds that we pass from special experiences to universal truths in virtue of "the inductive propensity—the irresistible impulse of the mind to *generalize* ad infinitum." *Whewell, Hist. Scientific Ideas, x., note.*

He continually meets with facts which prove that he had *generalized* on insufficient data.

H. Spencer, Social Statics, p. 514.

2. In *theol.*, the communication of the Divine Essence from God the Father to God the Son. The catholic or orthodox Trinitarian doctrine is that God the Son is a distinct person, truly God and of the same essence as the Father, and is therefore existent in his own personality as the Son from all eternity to all eternity, and that the divine act of generation is accordingly itself eternal or without beginning and without end: in opposition to the Arian teaching, that "there was formerly a time when he [Christ] was not, and that before being begotten he was not." The person or hypostasis of God the Son being "the express image [or *impressus*, *charactēr*] of his [God the Father's] person (*ὁμοούσιος*)" (Heb. i. 3), the communication of essence is that of a father to a son, and is accordingly *begetting* or *generation*; whereas the communication of the Divine Essence to the Holy Spirit is simply *procession*.

4. [*cap.*] The first book of the Old Testament. It records the creation of the world, the flood and the ensuing dispersion of races, and a more detailed history of the families of the Hebrew patriarchs Abraham, Isaac, and Jacob. The traditional and still widely prevalent view ascribes the authorship to Moses. Many modern scholars, however, find strong evidences of various periods of authorship, and particularly of two chief sources, the so-called *Jehovistic* and *Elohistic*. According to the latter view, the kingdoms of composition fall chiefly within the period of the kingdoms of Judah and Israel (about the eighth century B. C.), the last redaction occurring perhaps after the return from Babylon. In Hebrew the book is designated by its first word, *Bereshith*, 'In the beginning'; the title *Genesis* was supplied in the early Greek translation. Abbreviated *Gen.* See *documentary hypothesis* (under *documentary*), *Elohistic*, *Jehovistic*.

genitival (jen-i-ti'val or jen'ī-ti-val), *a.* [*Genitive* + *-al*.] Relating or pertaining to the genitive.

genitive (jen'ī-tiv), *a.* and *n.* [= *D. genitief* = *G. Dan. Sw. genitive, n.*; = *F. génitif* = *Pr. genitiu* = *Sp. Pg. It. genitivo*, < *L. genitivus*, usually in classical *L.* spelled *genetivus*, of or belonging to birth; in grammar, with or without *casus*, the genitive case (a mistranslation of *Gr. ἡ γενική πᾶσι*, the generic or general case, *γενικός* meaning also belonging to the family, also to generation, < *γενος* = *L. genus*), < *genitus*, pp. of *gignere*, *OL. genere*, beget, produce: see *genital, genus.*] **I. a.** In *gram.*, pertaining to or indicating origin, source, possession, and the like: an epithet applied to a case in the declension of nouns, adjectives, pronouns, etc., which in English is called the possessive case, or to the relation expressed by such a case: as, *patris*, 'of a father, a father's,' is the *genitive* case of the Latin noun *pater*, a father.

What is your *genitive* case plural, William? *Shak., M. W. of W.*, iv. 1.

II. n. In *gram.*, a case in the declension of nouns, adjectives, pronouns, etc., expressing in the widest sense a relation of appurtenance between one thing and another, an adjectival relation of one noun to another, or more specifically source, origin, possession, and the like; in English grammar, the possessive case.

The Latin *genitivus* is a mere blunder, for the Greek word *genikē* could never mean *genitivus*. . . . *Genikē* in Greek had a much wider, a much more philosophical meaning. It meant *casus generalis*, the general case, or rather the case which expresses the genus or kind. This is the real power of the *genitive*. If I say, 'a bird of the water,' 'of the water' defines the genus to which a certain bird belongs; it refers to the genus of water birds. 'Man of the mountains' means a mountaineer. In phrases such as 'son of the father' or 'father of the son,' the *genitives* have the same effect. They predicate something of the son or of the father, and if we distinguished between the sons of the father and the sons of the mother, the *genitives* would mark the class or genus to which the sons respectively belonged. *Maz Muller, Sci. of Lang.*, iii.

Abbreviated *gen*.

genius (jē'nus), *n.*; *pl. geniuses, genii* (jē'nus-ez, -nii). [*L. genius*, the tutelary spirit of a person, spirit, inclination, wit, genius, lit. 'inborn nature' (nature is from the same root), < *gignere*, *OL. genere*, ✓ *gen*, beget, produce: see *genus.*]

1. The ruling or predominant spirit of a place, person, or thing; the power, principle, or influence that determines character, conduct, or destiny (supposed by the ancients to be a tutelary divinity, a good spirit, or an evil demon, usually striving with an opposing spirit for the mastery); that which controls, guides, or aids: as, my good *genius* came to the rescue; his evil *genius* enticed him. [In this sense and the following the plural is *genii*.]

Some say, the *Genius* so
Cries, "Come!" to him that instantly must die.
Shak., T. and C., iv. 4.

The word *genii* hath by some writers been erroneously adopted for *geniuses*. Each is a plural of the same word *genius*, but in different senses. When *genius* in the singular means a separate spirit or demon, good or bad, the plural is *genii*; when it means mental abilities, or a person eminently possessed of these, the plural is *geniuses*.
G. Campbell, Philos. of Rhetoric, II. iii. 3.

A fairy shield your *Genius* made,
And gave you on your natal day.
Tennyson, Margaret.

After the third century, even the artistic type of the guardian *genius* reappeared in that of the guardian angel.

2. A disembodied spirit regarded as affecting human beings in certain ways, but not as connected with any one individually.

The Abyssinians, to a man, are fearful of the night, unwilling to travel, and, above all, to fight in that season, when they imagine the world is in possession of certain *genii*, averse to intercourse with men.

Bruce, Source of the Nile, II. 26.

3. A type or symbol; a concrete representative, as of an influence or a characteristic; a generic exemplification.

I do remember him at Clement's Inn, like a man made after supper of a cheese-paring: . . . he was the very *genius* of famine.
Shak., 2 Hen. IV., iii. 2.

A golden lizard—the very *genius* of desolate stillness—had stopped breathless upon the threshold of one cabin.
Bret Harte, Baby Sylvester (Tale of the Argonauts).

4. Prevailing spirit or inclination; distinguishing proclivity, bent, or tendency, as of a person, place, time, institution, etc.; special aptitude or intellectual quality; intrinsic characteristic or qualification: as, a *genius* for poetry, or for diplomacy; the *genius* of Christianity, of the Elizabethan period, of the American Constitution, of the Vatican.

Taking with him his two Sisters, he retired into a Monastery, they into a Nunnery. This does not suit with the *Genius* of an Englishman, who loves not to pull off his Clothes till he goes to bed.
Howell, Letters, I. iii. II.

Every age has a kind of universal *genius*, which inclines those that live in it to some particular studies.

Dryden, Essay on Dram. Poesy.

No woman can despise them [ceremonies] with impunity. Their *genius* delights in ceremonies, in forms, in decorating life with manners, with proprieties, order, and grace.
Emerson, Woman.

It is this tendency on the part of the collective speakers of a language to approve or reject a proposed change according to its conformity with their already subsisting usages that we are accustomed to call by the fanciful name "the *genius* of a language."

Whitney, Encyc. Brit., XVIII. 776.

Human nature has a much greater *genius* for science than for originality.
Lowell, Study Windows, p. 63.

5. Exalted mental power distinguished by instinctive aptitude, and independent of tuition; phenomenal capability, derived from inspiration or exaltation, for intellectual creation or expression; that constitution of mind or perfection of faculties which enables a person to excel others in mental perception, comprehension, discrimination, and expression, especially in literature, art, and science.

By *genius* I would understand that power, or rather those powers of the mind, which are capable of penetrating into all things within our reach and knowledge, and of distinguishing their essential differences.

Fielding, Tom Jones, ix. 1.

Genius always imports something inventive or creative.
H. Blair, Rhetoric, iii.

We owe to *genius* always the same debt, of lifting the curtain from the common, and showing us that divinities are sitting disguised in the seeming gang of gypsies and peddlers.

Genius loci. [*L.*] The presiding divinity of a place; hence, the pervading spirit of a place or an institution, as of a college. See def. 1. = **Syn. 5.** *Abilities, Gifts, Talents, Parts, Aptitude, Faculty, Capacity, Genius, Ingenuity, Cleverness*, all indicate special or excellent power for doing work that is more or less intellectual. *Abilities* is the most general and common word for intellectual powers of the active sort, intellectual competence to do effective work; *abilities* are always either acquired or developed. (See *ability*.) *Gifts* are strictly endowments, or abilities regarded as conferred by the Creator. (See *acquisition*.) *Talents* comes to the same idea, its biblical origin (*Mat. xxv. 14-30*) making the powers seem primarily intrusted to one for use, or at least given like money. *Parts* is retaining its former popularity and dignity, which it lost for a time; in the last century it stood for *talents* or *gifts*, excellent or superior endowments; as, he is a man of *parts*, or he is a man of good natural *parts*, the latter perhaps implying a failure to develop one's gifts. *Aptitude* is either natural bias or special fitness or skill; it may be native talent or disciplined ability. *Faculty* is cultivated aptitude, a highly trained power of doing something. The distinction between a *faculty* for and the *faculty* of should be noticed, the former being the kind of *faculty* now under consideration and the latter a bodily *faculty*, as the *faculty* of speech, hearing, etc. *Capacity* is receptive power: as, *capacity* to learn; it is a power of acquiring. "It is most remarkable in the different degrees of faculty with which different men acquire a language." *Sir J. Mackintosh*. (See *ability*.) *Genius* is extraordinarily developed *faculty*, in many directions or in one; it is especially the creative power of original conceptions and combinations; it belongs with *talents* or *gifts* in seeming primarily bestowed, not acquired, and it includes *capacity* and *aptitude* in their highest forms. *Ingenuity* is lower than *genius*, in seeming cultivated, not bestowed, in seeming less superhuman or phenomenal, and often in serving less exalted purposes: as, the *ingenuity* of the mechanic, of the rhetorician, of the sophist. *Cleverness* is still lower, being a sort of mental dexterity, which is evinced in facility in learning or felicity in expression; it may be a merely manual dexterity. (See quotation from Coleridge under *cleverness*.) It should be noticed that all these words, except *parts*, may be used in the singular for skill or power or natural bent in some particular direction: as, *ability* in debate, a *talent* for drawing, the *gift* of conversation, an *aptitude* for scientific research, *ingenuity* in argument, etc. See *wisdom* and *astute*.

As we advance in life, we learn the limits of our *abilities*.
Froude, Short Studies on Great Subjects, II. 313.

Conversation in its better part
May be esteem'd a *gift*, and not an art.
Corper, Conversation, I. 4.

The man of *talents* possesses them like so many tools, does his job with them, and there an end; but the man of *genius* is possessed by it, and it makes him into a book or a life according to its whim.

Lowell, Fireside Travels, p. 64.

All my endeavors to distinguish myself were only for want of a great title and fortune, that I might be used like a lord by those who have an opinion of my *parts*; whether

right or wrong is no great matter. And so the reputation of wit and great learning does the office of a riband or a coach and six. *Swift*, To Bolingbroke.

That his style was no easy acquisition (though, of course, the aptitude was innate), he [Dryden] himself tells us. *Lowell*, Among my Books, 1st ser., p. 30.

For, above all things, he had what we Yankees call faculty—the knack of doing everything. *G. W. Curtis*, Int. to Cecil Dreeme, p. 12.

As the sum and crown of what is to be done for technical education, I look to the provision of a machinery for winnowing out the capacities and giving them scope. *Huxley*, Tech. Education.

Sir Isaac Newton and Milton were equally men of *Genius*. Sir Robert Walpole and Lord Godolphin were ministers of great abilities, though they did not possess either the brilliant talents of Bolingbroke or the commanding genius of Chatham. *Sir J. Mackintosh*.

There is also another species of *genius* we call *ingenuity*, or the inventive faculty, which frequently accompanies or takes the place of the higher flights of *genius*, that meantime lies idle, or fallow, to recruit its powers. *Jon Bee*, Essay on Samuel Foote.

Patience and tenacity of purpose are worth more than twice their weight of cleverness. *Huxley*, Critiques and Addresses, p. 58.

genlesee, genterer, n. [The form *gentese* is no doubt wrong; the origin of *gentese* is uncertain.] An old architectural term of doubtful form and meaning: said by the Oxford Glossary to have been applied by William of Worcester apparently to the cusps or featherings in the arch of a doorway.

genoblastic (jen-ō-blas'tik), *a.* [*< genoblast + -ic*.] Germinating as a result of union of sexual elements; gamogenetic; pertaining to a genoblast. See the extract.

This author [E. Van Beneden] . . . suggests that the peripheral promucleus is probably partially formed of spermatogenic substance, that the central promucleus is female, and that the segmentation nucleus is a compound body resulting from the union of these two, and is probably, therefore, bisexual. This statement includes all the basal facts of the *genoblastic* theory. *A. Hyatt*, Amer. Jour. Sci., 5d ser., XXXI, 336.

Gentian (*Gentiana lutea*).

gentian, said to have been named after an Illyrian king *Gentius*, *Gr. Γέντιος*, who was the first to discover its properties.] The common name for species of the genus *Gentiana*. The official gentian, affording the gentian-root of pharmacists, is the *G. lutea*, a tall handsome species of southern and central Europe, though the roots of other species, as of *G. purpurea* and *G. pannonica*, are frequently substituted for it. The more common American gentians are the fringed gentian (*G. crinata*), with showy sky-blue, delicately fringed corollas, and the closed gentian (*G. Andreevii*) and soapwort-gentian (*G. Saponaria*), both with nearly closed corollas.

The flowers are usually blue, but are sometimes yellow, white, or (in the Andes) red. All the species are characterized by an extremely bitter principle, without astringency or acidity, on which account the roots of various species, especially of the European *G. lutea*, are used in medicine as a tonic. See *gentian*.—**Gentiana blue**. Same as *spirit-blue*.

In *gram.*, a noun or an adjective derived from the name of a country or locality, and designating its natives or people: as, the words *Italian*, *American*, *Athenian*, are *gentiles*.—*Syn. 2.* *Gentile*, *Barbarian*, *Pagan*, *Heathen*. A *barbarian* was to the Greeks a foreigner, especially one of alien speech; in the New Testament the word seems to mean a stranger or foreigner, but in *Rom. i.* 14 one not a Greek, and therefore not cultivated. Primarily, a *Gentile*, or the word of which it was a translation, signified to the Jews one not a Jew, but later one who was neither Jew nor Christian, or, from the Roman standpoint, one not a Roman. *Pagan* and *heathen* are primarily the same in meaning; but *pagan* is sometimes distinctively applied to those nations that, although worshipping false gods, are more cultivated, as the Greeks and Romans, and *heathen* to uncivilized idolaters, as the tribes of Africa. A Mohammedan is not counted a *pagan*, much less a *heathen*. See *infidel*.

The gentle (or gentler) sex, women collectively; woman-kind: opposed to the *sterner sex*. = **Syn.** 3 and 4. *Gentle*, *Meek*, *Bland*, *Soft*, *Tame*, *Mild*; placid, dove-like, quiet, peaceful, pacific, moderate, clement, lenient, merciful, kind, indulgent; tractable, docile. Of the first six words, *meek* applies only to personal character and behavior; it is wholly good in the Bible, and now indicates a defect of character only occasionally by hyperbole. The others may be either physical or moral. The meaning of *bland* is founded upon the pleasant feeling of warm breezes, etc.; it suggests a peculiarly soothing impression, as a *bland* demeanor, or an artful endeavor to make such an impression. *Soft* suggests that which yields somewhat upon physical contact, and hence anything not making firm resistance or striking hard. As to animals, *gentle* refers to nature, being opposed to *rough* or *fierce*, while *tame* is opposed to *wild*, and refers to familiarity with man: as, a *tame* duck. *Tame* is used in a bad sense of spirit and of intellectual productions: as, a *tame* spirit; some very *tame* remarks. *Mild* goes further than *gentle* in expressing softness of nature: it is chiefly a word of nature or character, while *gentle* is chiefly a word of action. *Mild* is sometimes opposed to *acrid*, *tart*, etc.

Technically—(a) In *logic*, that which can be predicated of things differing in species; a class having other classes under it.

We collect things under comprehensive ideas, with names annexed to them, into *genera* and species, i. e., into "kinds" and "sorts."

Locke, Human Understanding, II. xxxii. 6.

(b) In *zool.* and *bot.*, a classificatory group ranking next above the species, containing a group of species (sometimes a single species) possessing certain structural characters different from those of any others. The value assigned to a genus is wholly arbitrary—that is, it is entirely a matter of opinion or current usage what characters shall be considered generic and thus constitute a genus; and genera are constantly modified and shifted by specialists, the tendency being mostly to restriction of genera, with the consequent multiplication of their number, and the coinage of new generic names. A genus has no natural, much less necessary, definition, its meaning being at best a matter of expert opinion; and the same is true of the species, family, order, class, etc. A genus of the animal kingdom in the time of Linnaeus and other early naturalists was a group of species approximately equivalent to a modern family, sometimes even to an order. Probably upward of 100,000 generic names of as many supposed genera have been coined or used in zoology; those in current use at present are estimated at about 60,000, or an average of about (rather more than) one genus for every five species in the animal kingdom. In botany the genera are less restricted and average a much larger number of species, the 9,000 phanerogamic genera, for example, including 100,000 species. The tenable name of any genus is that which has priority of publication, if it has been properly published and characterized, and is not the same as the prior name of some other genus. The names of the genus and the species together form the scientific name of an animal or a plant. In writing the technical name of any animal or plant, the generic term always precedes the specific, and begins with a capital letter: as, *Musca domestica*, the house-fly, where *Musca* is the genus, and *domestica* differentiates the species. Genera are often subdivided into lesser groups called subgenera. (See *subgenus*.) A group of genera constitutes a family or subfamily. The name of a genus as such has properly no plural. If a genus name, as for example *Ada*, is pluralized, as *Adæ*, it means, not two or more genera named *Ada*, but either (a) all the species of *Ada*, or (b) some supergeneric group of which *Ada* is the type. The former usage is loose, or somewhat cant; the latter is frequent and regular in zoology. A genus name is always supposed to be Latin (though its derivation is in the great majority of cases from the Greek), and its plural, if used, is in Latin form; but when it is also Anglicized an English plural is used: as, the *chinchillas*, the animals of the genus *Chinchilla*.

Genera are most closely allied groups of animals, differing . . . simply in the ultimate structural peculiarities of some of their parts; and this is, I believe, the best definition which can be given of genera.

Agassiz, Essay on Classification, ii. § 5.

(c) In *old music*, a formula or method of dividing the tetrachord. Three genera were distinguished: the diatonic, in which whole steps or "tones" were used; the chromatic, in which only half-steps or semitones were used; and

the enharmonic, in which intervals less than a half-step were used.—Highest, supreme, or most general genus, in *logic*, a genus which has no higher or supravent genus.—Homonymous genus, a genus to which the different species under it do not belong in the same sense; an equivocal genus.—Subaltern or middle genus, a genus which is at the same time a species of a higher genus.

of the intensity of gravity in different regions, by means of direct observation and measurement. The operations of topography and hydrography are now considered as extraneous to geodesy, but leveling of the most precise kind is included, as well as the observation of the tides. Also *geodetics*.

'earth-describing,' < γη, the earth, + γραφειν, write.*] 1. The science of the description of the earth's surface in its present condition, and of the distribution upon it of its various products and animals, especially of mankind, etc. See phrases below. The object of the geographer is to describe the earth's surface as it now exists. The geologist, on the other hand, seeks to throw light on the past history of the globe, although in doing this he must constantly refer to and study its present condition. Abbreviated *geog.*

Same as *physiography*. — **Political and historical geography**, the study of the division of the earth's surface among different tribes, peoples, and governments. Simple *political geography* is the study of the present condition of things in that respect; *historical geography* investigates and records the changes in the governmental control of territory which have occurred from time to time. This branch of the science is, in fact, history from a geographical point of view, or that kind of history which, to be made intelligible, requires the aid of maps. — **Sacred or Biblical geography**, the geography of Palestine and other Oriental countries mentioned in the Bible, having for its object the elucidation of Scripture.

It. geologia* = *D. G. geologie* = *Dan. Sw. geologi*, < *NL. geologia*, < *Gr. γη, the earth, + λογία, < λέγειν, speak: see -ology.*] The science of the past and present condition of the earth, with special reference to the physical changes which it has undergone or which may still be taking place. Almost every branch of physical and natural science is, or may be, called upon to throw light on the problems which present themselves to the geologist. Closely connected with geology, and indeed almost inseparable from it, is paleontology, or the study of ancient forms of life, since the rocks are found on examination to contain in many places remains of plants or animals, sometimes closely resembling, and often very different from, any now living on the earth. It is almost exclusively the order of succession of forms of life thus found which gives the geologist the means of making out a chronological arrangement for the different stratified formations. Physical geography, or physiography, is the necessary introduction to geology, and forms the link which unites the work of the geographer to that of the geologist. Abbreviated *geol.* See *paleontology, petrography, and lithology*. — **Agricultural geology**. See *agricultural*. — **Dynamic geology**. See *dynamic*. — **Physical geology**. See *physical*. — **Structural geology**. See *structural*. — **Syn. Geology, Geognomy**. Both mean the same thing; but, with an unnecessary degree of refinement in terms, it has been proposed to call our description of the structures of the earth *geognosy*, and our theoretical speculations as to its formation *geology*. *Sir C. Lyell*, *Prin. of Geol.* (4th ed., 1835), I. 388.

With the advance of the thirteenth century, the severity and geometric simplicity of line in tracery and ornament became less marked, and the style passed gradually into the Decorated. Geometridæ (jê-ô-met'ri-dê), *n. pl.* [NL., < *Geometra* + *-idæ*.] A large family of heterocerous lepidopterous insects or moths, named from the genus *Geometra*, whose larvae are measuring-worms; the geometers, geometrids, phalaenids, or *Phalaenidæ*. This group, regarded as a family, is divided into 26 subfamilies, named *Uperidinae*, *Ennominae*, *Euchrominae*, *Amphidasiinae*, *Boarmiinae*, *Boletobolinae*, *Geometrinae*, *Microsericeae*, *Patalyadinae*, *Ephyrinae*, *Acidaliinae*, *Mecocercinae*, *Caberinae*, *Macarinae*, *Pidoninae*, *Uziniinae*, *Zereneinae*, *Liginae*, *Hyberinae*, *Laricinae*, *Eubolinae*, *Sioninae*, *Uedylinae*, *Erastinae*, *Emplocinae*, and *Hypocrocinae*. In some systems, as Guenée's, these are all elevated to the rank of families, ending in *-idæ*, and the superfamily thus constituted, called *Phalaenites*, is the *Geometrina* of English authors. The names *Geometridæ* and *Phalaenidæ* are exactly synonymous; and the various names resulting from the changes in termination of the two words are applied to what is practically an identical group of moths, rated higher or lower in the taxonomic scale, according to the classificatory views of different authors. See the extract, and *cuts* under *Cutaria* and *Haploides*.

The *Geometridæ* or *Phalaenidæ* form a family of great size, being exceeded in numbers among the Lepidoptera only by the noctuids and tenebrionids, and probably equalled only by the pyralids and tortricids. They are . . . widely distributed over the globe, and the caterpillars of many species have proved very destructive to some of our most important vegetable productions. The moths have rather long, slender bodies, the thorax without tufts or crests. Ocelli are present in some species, and absent in others. The antennae are either simple, ciliated, or pectinated. The fore wings are large and triangular; the outer margin . . . is nearly as long as the hinder margin. The hind wings are ample. . . . In some [species], the females are wingless, or have only rudimentary wings, which are useless for flight. . . . The caterpillars are slender and naked, usually with two pairs of abdominal legs, though rarely they have three or four pairs. This deficiency causes them to move along with a looping gait, and hence they are often called "measuring-worms," from which fact the family name [*Geometridæ*] was given.

2. A text-book of geometry.—**Abstract geometry**, the general theory of the connections of more than two variables. Geometry, in its analytical treatment, appears as identical with the algebra of two or three variables. A similar study of the connections of a number of variables in general is called *n*-dimensional geometry, and abstract geometry as not descending to particulars.

—**Algebraic, arithmetic, analytical, Cartesian, coordinate, etc., geometry.** See the adjectives.—**Common or elementary geometry**, that treatment of geometry which assumes no previous knowledge of the subject, and is supposed to be well known in all other mathematical writings. This discipline remains in nearly the condition in which Euclid left it. See *Euclidean geometry*.—**Descriptive geometry** (invented by Gaspard Monge, 1794), the theory of making projections of any accurately defined figure such that from them can be deduced, not only its projective, but also its metrical properties. It is highly useful in engineering. The name is also applied to the theory of geometry in general treated by means of projections.—**Elliptic geometry**, a system which assumes that space returns into itself, so that there are no points whose distance exceeds a certain finite distance.—**Enumerative or denumerative geometry**, the theory of the number of solutions of geometrical problems, and of the number of incidences and coincidences in a diagram drawn under given conditions.—**Euclidean geometry**, a system of geometry which adopts the assumptions of Euclid with regard to space, namely, that space is an infinite continuum of three dimensions, that rigid bodies are capable of translation and rotation in all directions in every position, and that the sum of the three angles of a plane triangle is equal to two right angles.—**Geometry of forces**, the theory of congruencies and complexes of forces.—**Geometry of position.** (a) A branch of geometry created by the French revolutionary statesman Carnot, which traces the connection between the changes of an equation and the changes of position of a locus. (b) Modern projective geometry, commonly written in German *Geometrie der Lage*, to distinguish it from (a).

—**Geometry of space, geometry of three dimensions**, geometry of figures not restricted to a plane or other surface.—**Geometry of the compasses**, a system of geometry in which the postulate that a right line be describable is not admitted, but instead links turn about pivots and are connected together. The first important discovery in this branch of geometry was the Peaucellier cell. See *cell*.—**Graphical geometry.** Same as *projective geometry*.—**Higher geometry**, any geometry not elementary; especially, modern synthetic geometry.—**Hyperbolic geometry**, a system which assumes that space, though infinite in measurement, has a real and definite boundary, separating the points at a real distance from points at an imaginary distance.—**Linear or line geometry**, the theory of systems of rays, congruencies, and complexes.—**Metric or quantitative geometry** treats of the distances of points or the magnitude of angles, arcs, surfaces, volumes, etc.—**Modern geometry**, the synthetic geometry which has been developed in the nineteenth century by Carnot ("Géométrie de position," 1803), Brianchon ("Mémoire sur les lignes du second ordre," 1817), Poncelet ("Traité des propriétés projectives des figures," 1822), Möbius ("Barycentrische Calcul," 1827), Steiner ("Systematische Entwicklung," 1832), Chasles ("Géométrie supérieure," 1832), von Staudt ("Géometrie der Lage," 1847), and others.—**Organic geometry.** (a) A kind of geometry invented by MacLaurin (1719), in which more complicated curves are produced from less complicated ones. Hence (b) Higher synthetic geometry in general.—**Parabolic geometry**, a system which assumes (in harmony with Euclidean principles) that the locus at an infinite distance consists of two coincident planes with an imaginary circle upon them.—**Plane geometry**, the geometry of figures all lying in one plane.—**Practical geometry.** (a) Surveying. (b) The art of geometrical drawing.—**Projective geometry**, a method of investigating geometry by the application of the theory of projections.—**Segmentary geometry**, modern synthetic geometry, especially when treated by means of the anharmonic ratio.—**Solid geometry.** (a) The elementary geometry of solid bodies. (b) Geometry of three dimensions.—**Speculative geometry**, the science of geometry proper, as distinguished from *practical geometry*.—**Spherical geometry**, the geometry of figures drawn on the surface of a sphere.—**Synthetic geometry**, geometry treated not by means of coordinates or other algebraic devices, but by means chiefly of projections.—**Theoretical geometry.** Same as *speculative geometry*.—**To hang by geometry**, to have the clothes hang angularly, out of shape, or in rags.

The making of the Alleghany range was carried forward through a long-continued subsidence—a *geosynclinal*—not a true synclinal, since the rocks of the bending crust may have had in them many true or simple synclinals as well as anticlinals.

The powers of growth which exist in young seedlings would certainly be called instinctive if they existed in animals, and they are quite as indispensable as those just mentioned in supplying the wants which first arise. These two instincts are the power of directing the growth in relation to the force of gravity, and in relation to light; the first being called *geotropism*, the second *heliotropism*. E. Darwin.

The order as now understood is very polymorphous, comprising a half-dozen or more tribes which have been ranked as distinct orders by some authorities. It includes 20 genera and 750 species, distributed through the temperate and subtropical regions of the globe, but especially abundant in South Africa. Most of the species are astringent, and the roots of several have been used in medicine, as of the *G. maculatum*, a common plant in the United States. From the long beak of the fruit, the common species have received the name of *crane's-bill*. The herb-robert, *G. robertianum*, with dissected leaves, is native of both Europe and the United States.

In *biol.*, the first rudiment of any organism; the earliest stage in the development of an organism; the simplest recognizable condition of a living thing; in *bot.*, technically, the embryo of a seed, or, in the Linnean use of the word, the ovary. In popular language often used specifically to denote the mature spores of fungi and of other lower cryptogams, especially of injurious kinds, and, in the case of bacteria, the entire organism.

Germ theory. (a) In *biol.*, the doctrine of biogenesis; the theory that living matter cannot be produced by evolution or development from non-living matter, but is necessarily produced from germs or seeds. The doctrine is opposed to that of abiogenesis, or spontaneous generation. See *biogenesis*. (b) In *pathol.*, the doctrine that zymotic diseases, together with some not usually classed as zymotic, are due to the presence in the body of living organisms. These organisms, which, so far as they have been positively identified, belong for the most part to the group of bacteria, produce their morbid effects by their

vital activity, and probably in large part by the formation of poisons called *ptomaines*. This doctrine no longer rests upon indirect evidence alone, but also on the positive identification of the peccant organisms in a certain number of diseases, as in phthisis, anthrax, relapsing fever, typhoid fever, and some others. — *Syn. Fetus, Rudiment, See embryo.*

German² (jër'man), a. and n. [*< L. Germanus, a. and n., German, Germani, n. pl., the Germans, Germania, Germany.* The name is prob. of Celtic origin, and is said to mean 'shouters,' or, according to another explanation, 'neighbors.' The G. word for 'German' is *Deutsch*; 'a German,' *ein Deutscher*: see *Deutsch*.] **I. a.** Of or pertaining to an important Teutonic race inhabiting central Europe, or to Germany, or to its inhabitants or their language. At the beginning of the Christian era the Germans occupied central Europe eastward to the Vistula, southward to the Carpathians and Danube, and westward to beyond the Rhine. Among their chief tribes were the Suevi, Lombards, Vandals, Heruli, Chatti, Quadi, Ubi, and Cherusci. After the epoch of migrations in the third and fourth centuries, many tribes, as the Franks, Burgundians, Lombards, and Vandals, settled permanently in other regions, and became merged in the new French, Italian, and Spanish nations. In the East the Germans were displaced by Slavs, although important parts of this region have since been Germanized. Since about the twelfth century the Germans have called themselves *die Deutschen*. In medieval and modern times they have occupied a region which has had many political changes, but which has remained of substantially the same extent for centuries. The former Roman-German empire contained various lands not inhabited by Germans. At the present time the Germans form the great majority in the reconstituted German empire; they number over one fourth of the inhabitants of Austria-Hungary, chiefly in the western and northwestern parts; there are about 1,000,000 Germans in the Baltic provinces and elsewhere in Russia, and over two thirds of the Swiss are of German race and language. Abbreviated *Ger.* or *G.* — **German Baptists.** See *Bunker*. — **German bit, black, etc.** See the nouns. — **German carp,** an English book-name for the *Carassius vulgaris*, or gibelio. — **German Catholic,** one of a religious party or body in Germany whose members seceded from the Roman Catholic Church in 1844 and succeeding years, and gradually adopted various ideas different from those of orthodox Christianity. Its progress was hindered by governmental interference and by internal disputes between the two chief leaders, Ronge and Zerski. After the reaction from the revolution of 1848 nearly all its members were gradually absorbed in other religious bodies. — **German duck.** See *duck*². — **German empire.** See *Holy Roman Empire*, under *empire*. — **German flute.** See *flute*¹, 1 (c). — **German fringe, gold, hone, millet, etc.** See the nouns. — **German paste,** a kind of paste composed of pea-meal, sweet almonds, lard, sugar, hay-saffron, and hard-boiled egg, used for feeding larks, thrushes, nightingales, and other singing birds. — **German plate-glass.** Same as *broad glass* (which see, under *broad*). — **German porcelain and pottery,** porcelain and pottery produced in Germany. The best-known varieties of German porcelain are those of Meissen (generally called Dresden) and Berlin. Other celebrated factories are those of Anspach, Höchst, Frankenthal, Ludwigsburg, Nymphenburg, and Grossschreibach. — **German sarsaparilla, silver, etc.** See the nouns. — **German sixth, in music,** a chord of the extreme sixth, containing the major third and perfect fifth of the bass, as shown in the figure. — **German snipe,** the dowitcher: so called in distinction from English snipe. Also called *Dutch snipe*. — **German stitch,** a stitch used in worsted-work, in which alternately a tapes-

try-stitch and a tent-stitch are worked, forming a diagonal line. — **German text,** a form of black-letter with profusely flourished and very large capital letters.

II. n. 1. A member of the German race, or a native or an inhabitant of Germany. See **I.** — **2.** The language of Germany or of the German people, a sub-branch or division of the Teutonic or Germanic branch of Indo-European or Aryan language. Its two principal divisions are the Low German, of the northern or lower part of the country, and the High German, of the southern or higher part. See *High German*, *Low German*, below.

3. Especially, the literary language of Germany. It is one of the High-German dialects, the former court and official dialect of Saxony (though not entirely free from elements of other dialects), and was brought into general learned and literary use, early in the sixteenth century, by Luther's writings, especially by his translation of the Bible. — **High German,** a collective name for the dialects of central and southern Germany, as distinguished from the Low German of the north. The dialects it includes are many and of various groups, as Alemannic, Frankish, Austrian, etc. Its history is divided by the existing literary documents into three periods: Old High German, from the eighth to the twelfth century (the leading dialect Frankish, the literature chiefly Christianizing); Middle High German, from the twelfth to the sixteenth century (one of the leading dialects Swabian, the literature chiefly epic, as the *Nibelungenlied* and *Helden-sagen*, and lyric, as the writings of the Minnesingers); and the New High German, or the Modern German, or German from the sixteenth century down. See above. — **Low German,** a collective name for the dialects of northern Germany and the Low Countries, among which the Netherlandish or Dutch and the Plattdeutsch have literatures at the present time. In a restricted sense, the name is applied to the Low German as spoken in the northern parts of Germany. It is divided historically into three periods, Old Low German, Middle Low German, and Modern Low German, corresponding substantially to the periods of High German. The dialects of the Teutonic invaders of Britain were of the Old Low German class. See *Anglo-Saxon*, *English*, *Frisian*, *Dutch*, etc.

Specifically, in bot.: (a) The process of development of the embryo of a seed into a perfect plant. The conditions necessary for germination are the presence of moisture, free oxygen, as in atmospheric air, and warmth. Moisture softens the integuments of the seed and relaxes the tissues of the embryo, at the same time dissolving such nutrient matters in the seed as sugar, dextrine, etc., in readiness for their assimilation by the embryo. The absorption of oxygen is necessary for the chemical changes which always accompany growth. The degree of warmth needed to excite to action the vital forces of the plant varies in different species, some seeds, as those of wheat, being capable of germinating upon melting ice, while others require a temperature of over 60° F. During germination various chemical changes take place in the starch and other insoluble material stored up for the use of the embryo in the cotyledons or in the albumen of the seed, rendering them soluble and fit for assimilation, which changes are usually accompanied by an increase of temperature, as is seen in the process of malting. As an immediate result of the growing process thus excited and carried on in the seed, a root is produced which strikes downward, fixing itself in the soil and beginning to absorb thence nourishment for the new plant. At the same time the other extremity of the axis of growth is directed upward and develops a stem and leaves. (b) The similar development of a plant from the spore in cryptogams. (c) The early period of growth in a bud, as of a bulb or of a rhizome. (d) The protrusion and growth of the pollen-tube from the pollen-grain.

germ-layer (jĕr'm'lä'er), *n.* In *biol.*, any blastodermic membrane or blastoderm; any layer of cells, forming a membrane, which enters into the structure of a germ in its early stages. The first is the single blastoderm of a blastula or vesicular morula. By invagination this germ-form becomes a gastrula, with two germ-layers, the hypoblastic blastodermic layer, or endoderm, and the epiblastic blastodermic layer, or ectoderm; development between which two of a third mesoblastic layer of cells, or mesoderm, and subsequent splitting of this into an inner and an outer layer, called splanchnopleure and somatopleure, results in the four-germ-layers of most metazoic animals. Names of special germ-layers or germ-membranes are: *blastophylla*, *epiblast*, *mesoblast*, *hypoblast*, *endoderm*, *ectoderm*, *mesoderm*, *somatopleure*, *splanchnopleure*, etc. They are also called *layers*, as skin-layer, serous layer, etc. See cuts under *gastrula* and *gastrulation*.

The Metazoa can alone be considered as true animals, and the origin from two primary *germ-layers* may be held to form the primary character of the animal kingdom.

The *germ-plasma* is regarded as a substance of peculiar chemical or even more special molecular composition, which passes over from one generation to another.

Jour. Roy. Micros. Soc., 1886, p. 213.

germ-pore (jĕr'm'pōr), *n.* In *cryptogamic bot.*, a pore or pit in the outer integument of a spore, through which the exit of the germ-tube takes place.

Many of these pores serve as places of exit for the tubular outgrowths from the spore at the time of germination, and may therefore be termed *germ-pores*; others perform no such function, and are therefore only simple pores or pits.

De Bary, *Fungi* (trans.), p. 100.

germ-shield (jĕr'm'shēld), *n.* Same as *notaspis*.

germ-tube (jĕr'm'tūb), *n.* In *cryptogamic bot.*, a tubular or thread-like growth first formed by a spore in germination, which by continued development and cell-division in one or more directions becomes the thallus. In fungi the germ-tube may develop into either the ordinary mycelium or a promycelium.

germule (jĕr'mul), *n.* [*< germ* + *dim. -ule*.] A germ; especially, a small or incipient germ.

The majestic tree of human thought can never be comprehended unless regard is had to the formless *germule* of the psychical life of the zoophyte, and ascending evolution is followed up in the animal series.

germ-vesicle (jĕr'm'ves'i-kl), *n.* In *embryol.*, a germ in a vesicular state. It is either (a) a true germ-vesicle or blastula, preceding gastrulation, as in most animals, or (b) an intestinal germ-vesicle or gastrocystis, peculiar to mammals; in the latter case it follows gastrulation, and is generally confounded with a blastula; it is what is called in human anatomy the blastodermic vesicle. See *blastosphere*, *gastrocystis*, and cut under *gastrulation*.

The gerontes held office for life; their functions were partly deliberative, in that they prepared measures to be laid before the popular assembly, partly executive, and partly judicial. With the ephors and kings, they constituted the supreme authority of the state.

gerontikon (ge-ron'ti-kon), *n.*; pl. *gerontika* (-kū). [*L*Gr. *γεροντικόν*, neut. of *Gr. γεροντικός*, of an old man, < *γέρων* (*geron*), an old man.] In the *Gr. Ch.*, a book containing a collection of anecdotes and apothegms or sayings of ancient anchorites and monastic fathers.

It is now known, however, that he was opposed to the measure.] In *U. S. politics*, an arbitrary arrangement of the political divisions of a State, in disregard of the natural or proper boundaries as indicated by geography or position, made so as to give one party an unfair advantage in elections. [The following specimen of the capabilities of *get*, transitive and intransitive, is given by Dr. Withers:]

I got on horseback within ten minutes after I got your letter. When I got to Canterbury, I got a chaise for town; but I got wet through before I got to Canterbury; and I have got such a cold as I shall not be able to get rid of in a hurry. I got to the Treasury about noon, but first of all I got shaved and dressed. I soon got into the secret of getting a memorial before the board, but I could not get an answer then; however, I got intelligence from the messenger that I should likely get one the next morning. As soon as I got back to my inn, I got supper and got to bed. It was not long before I got to sleep. When I got up in the morning, I got my breakfast, and then I got myself dressed that I might get out in time to get an answer to my memorial. As soon as I got it, I got into the chaise, and got to Canterbury by three, and about tea-time I got home. I have got nothing for you, so adieu.

=Syn. *Ghastly*, *Grim*, *Grisly*, *Haggard*, *Hideous*; pale, wan, cadaverous, frightful. *Hideous* may apply to sound, as a *hideous* noise; the others not. All in modern use apply primarily to sight and secondarily to mental perception, except *haggard*, which connotes sight only. *Ghastly*, as it is most commonly used, means deathly pale, death-like, referring to the countenance, but its signification has been extended to denote anything that is suggestive of death, or even repulsive and shocking, as Milton's "mangled with *ghastly* wounds" (*P. L.*, vi. 28), "a *ghastly* smile" (*Milton*, *P. L.*, ii. 846), a *ghastly* jest. *Grim* characterizes a rigid cast of countenance, indicating a severe, stern, or even ruthless disposition. *Grisly* refers to the whole form or aspect, especially when dark, forbidding, or such as to inspire terror. *Haggard* adds to the idea of paleness of countenance that of being wasted by famine or protracted mental agony. *Hideous*, used of looks, applies to the whole form or scene, and means simply repulsive, extremely unpleasant to see: as, *hideous* features; a *hideous* scene. See *pale*².

nearly 100 feet. The height of the column is probably diminishing, as some old estimates make it much greater. There are numerous geysers in the Yellowstone region of the United States, some of which throw water to an elevation of 200 feet or more, and also on the North Island of New Zealand; and in the Napa valley of California are boiling springs that have been improperly called geysers. (See *boiling spring*, under *boiling*.) The true theory of the action of the Great Geyser of Iceland, and hence of geysers in general, was first established by Bunsen. The ejection of the water is caused by explosive action, due to the heating of the water, under pressure, in the lower part of

The decoration was a gold cross attached to a blue ribbon, and the emblems were a dove and an image of St. Michael. The order has been in abeyance since the revolution of 1830. A *specter* is an alarming or horrifying preternatural personal appearance, having less individuality, perhaps, than a *ghost* or *shade*, but more than an *apparition* necessarily has. A *phantom* has an apparent, not a real, existence; it differs from a *phantasm* in emphasizing the unreality simply and in representing a single object, while *phantasm* emphasizes the deception put upon the mind, and may include more than one object.
